Thanks for sending this to me, John. I took a look at the numbers and these appear to pose no concern at all based on surface water quality criteria. I recognize there's some retention and mixing going on with the "regular" discharge from Murphy, but even if this was an individual discharge to Newton Creek or Lake Michigan, these levels don't appear to pose a concern. SO from what I see here, everything looks good!

Let me know if you have any further questions. - Jim

Jim,

See the attached results we discussed and my email to Chuck below. Murphy oil called me once yesterday and twice today looking for an answer. Thanks for your help.

Chuck,

Attached are sample results from a water sample from the containment area of Tank #30 at Murphy Oil. Murphy had a gasoline spill into containment at Tank 30 this past winter. They have been pumping water from snowmelt and rainwater that collects in the containment area to the wastewater treatment plant. Murphy has requested stopping collection of this water and reopening the drainage valve to allow this water to discharge with surface runoff as normal. I would like your opinion.

Thanks.
