Revised Community Involvement Plan

Penta Wood Products Superfund Site

Town of Daniels, Wisconsin

W.A. No. 010-CRCR-05ZZ/Contract No. 68-W6-0025

March 2000

Introduction

This revised Community Involvement Plan (CIP) for the Penta Wood Products Superfund site was prepared by the U.S. Environmental Protection Agency (U.S. EPA), which is responsible for community involvement and cleanup activities at the site under the federal Superfund program. This CIP revises the original CIP done in 1995. It provides background information on the site and recommends activities U.S. EPA will do to continue to inform the public and local officials about progress at the site, and to encourage community involvement during the site cleanup.

This revised CIP also discusses Burnett County residents' and local officials' concerns regarding the site and ways for U.S. EPA to address them. The information in this plan is based primarily on discussions held in February 2000 with Burnett County residents and officials.

Site Description

Location and Site Features

The Penta Wood Products site is an 82-acre inactive wood treating facility located on Daniels 70 (formerly State Route 70) in Burnett County, Wisconsin. It is located in the Town of Daniels, approximately 3 miles west of Siren. The property is located in an agricultural and rural residential setting and is bordered on the east, west and north by forest and open field. With the exception of a small portion of the site, Daniels 70 forms the southern site boundary. There are two residences south of Daniels 70 within 200 feet of the site. Approximately 8 acres of the site are located south of Daniels 70 and bordered on the east by a farm, on the south by agricultural land, and on the west by a residence and a Wisconsin Department of Natural Resources (WDNR) fire tower.

The site consisted of a main treatment building, and oil/water separator building, a gully where waste water was discharged, a waste-water lagoon, a wood chip pile, and several other buildings including sawmills, garages, and storage sheds. (Portions of the treatment building and the oil/water separator building were demolished during U.S. EPA's 1994-1996 "removal action.") The lagoon, once a holding pond for wastewater, is now a dry basin. A wetland is located off site about 400 feet north of the lagoon. The remaining buildings on the site were demolished in March 2000 as part of the cleanup.

Doctor Lake and an unnamed lake are located 2,000 feet east and northeast of the site, respectively. About 2,137 acres of lakes, 94 acres of bogs, and 7,500 acres of wetlands are within a 4-mile radius of the site. The Amsterdam Slough Public Hunting Grounds is located 1 mile north of the site.

Site Background

Penta Wood Products operated from 1953 to 1992. Raw timber was cut into posts and telephone poles and treated in process tanks in closed buildings with a pentachlorophenol (PCP) solution in a No. 2 fuel oil, or with a water-borne salt treatment called Chemonite consisting of ammonia, copper II oxide, zinc, and arsenate (ACZA).

During its operation, Penta Wood Products discharged PCP/oil-contaminated wastewater from an oil/water separator tank down a gully into the lagoon on the northeast corner of the property. PCP/oil- and metals-contaminated wastewater were also discharged onto a wood chip pile in the northwest portion of the property. WDNR investigators noted several large

spills, stained soil and poor operating practices during site inspections in the 1970s. The 8-acre portion of the site located south of Daniels 70 was used to transfer a PCP/oil mixture to buyers. In 1988, the WDNR closed an on-site well used for drinking water when high concentrations of PCP were found. In 1989, the Wisconsin Department of Transportation detected high levels of PCP in surface soil samples collected from highway right-of-way on the south side of Daniels 70. In May 1992, Penta Wood Products closed. Between 1993 and 1996, U.S. EPA conducted on-site investigations and removed 43,000 gallons of PCP/oil mixture and sludge and emptied 28 storage tanks containing liquid and sludge. In 1996, U.S. EPA placed the site on its National Priorities List, a list of the nation's most serious uncontrolled or abandoned hazardous waste sites. U.S. EPA began implementing its long-term cleanup plan in March 2000.

Community Background

The unincorporated Town of Daniels is located on Daniels 70 (formerly State Route 70), and just west of Siren in northwestern Wisconsin. The table below summarizes housing, income and population characteristics for the Town of Daniels and Burnett County. The Town of Daniels' and Burnett County's income and housing figures show that they are less than the state-wide average.

Community	Median Household Income (1989)	Median Home Value (1989)	Population (1998 estimate)
Town of Daniels	$18,750	$38,000	621
Burnett County	$20,153	$44,700	14,646
State of Wisconsin	$29,442	$62,100	5,222,124

Source: U.S. Census Bureau, 1990; Wisconsin Department of Administration, 1999.

Status of Community Involvement Activities

U.S. EPA's community involvement activities began in March 1994, when the first public meeting was held to discuss the Superfund program, future actions at the site, health concerns, and to address questions and concerns. In November 1994, a second public meeting was held to discuss the ongoing removal action at the site. A public meeting was held in July 1998 to explain the proposed cleanup plan and the alternatives presented in a document called the Feasibility Study (FS). A 30-day public comment period ran from July 7 to August 8 to accept comments on the Proposed Plan and other cleanup alternatives presented in the FS.

Fact sheets and update letters were completed throughout U.S. EPA's investigation to announce public meetings, to update residents on activities taking place at the site, and to answer frequently asked questions. The fact sheets were distributed to those on the mailing list, which included area residents, local officials, media contacts, and other interested parties.

Community interviews were held in Burnett County on February 9 and 10, 2000 to provide information for this revised CIP. The purpose of the community interviews was to obtain area residents' and local officials' concerns about the site, determine what information they wanted U.S. EPA to provide them, and the best way to disseminate that information.

Community Issues and Concerns

Overall, very few residents and local officials have concerns about the Penta Wood site. Almost all residents and local officials interviewed in February 2000 do not believe the site poses a health risk in its current condition. In fact, many question the need to clean up the site. Some residents also believe the money spent on site investigations and cleanup is not a worthwhile investment.

Officials acknowledged that a key factor in the community's lack of concern over the site is its rural location. It is located several miles from the nearest community (Siren, 930 population). In addition, State Highway 70, which formerly bisected the site, was re-routed to the south and the site is no longer visible from the highway. As a result, only a handful of local residents pass by the site on a regular basis.

Some residents also cited the apparent lack of health problems experienced by former site workers as evidence that the site poses no health risk.

Proposed Community Involvement Activities

Site Tour/Open House

At end of the cleanup, which is scheduled for September 2000, U.S. EPA will host an open house/site tour. U.S. EPA's community involvement coordinator and remedial project manager, WDNR project manager, and U.S. EPA's construction management contractor will lead tours. To inform the public and local officials of the open house/site tour, it will be announced in an invitation or update letter sent to the site mailing list and in a public notice placed in the *Inter-County Leader* and *Burnett County Sentinel.*

Fact Sheets/Update Letters

At least one additional fact sheet will be needed to describe the completed cleanup. The fact sheet will be mailed to the site mailing list prior to the site tour/open house and/or will be distributed at the site tour/open house.

Information Repository

Information repositories were established at the Burnett Community Library, 7451 West Main Street, Webster and the Grantsburg Public Library, 416 South Pine Street, Grantsburg. They contain information about the investigation, cleanup and the Superfund program. An Administrative Record, which contains all of the information upon which the selection of the cleanup plan was based, is located at the Burnett Community Library and also at the U.S. EPA Region 5 office in Chicago.

Media Relations

The most widely read newspapers in the community are the *Inter-County Leader* and *Burnett County Sentinel.* U.S. EPA will publish notices in these newspapers prior to the planned open house/site tour and other site milestones as appropriate.

Internet

U.S. EPA will post site tour/open house information on its home page (www.epa.gov/region5/sites). Photos and other site-related information will also be added to the home page, as necessary.

U.S. EPA Presence and Contacts

Throughout the cleanup, U.S. EPA's community involvement coordinator and remedial project manager will respond to telephone inquiries from those interested in the site. U.S. EPA's toll-free telephone number and the project staff's direct numbers and e-mail addresses are listed below and will be included on all community involvement material.

1. INTRODUCTION

A Community Involvement Plan (CIP) is prepared for each **Superfund** site as a tool for the United States Environmental Protection Agency (EPA) to learn about the community and how to best respond to its needs. The following sections describe this CIP and explain the activities involved in the Superfund process. Words in bold are defined in the Glossary in Attachment C.

1.1 PREPARATION OF THE COMMUNITY INVOLVEMENT PLAN

This CIP identifies issues of community concern with regard to the Penta Wood Products Superfund site in Burnett County, Wisconsin, and outlines community involvement activities to be conducted by EPA during the **remedial investigation and feasibility study (RI/FS)** of the site.

The EPA Region V Office of Superfund will be responsible for managing the RI/FS. EPA Region V, Office of Public Affairs, will oversee all community involvement activities at the Penta Wood Products site.

This CIP has been prepared to aid EPA in developing and implementing a community involvement program tailored to the needs of the community potentially affected by the Penta Wood Products site. EPA conducts community involvement activities to ensure that the local public is well informed about the progress of the Superfund process and has the opportunity to provide input about Superfund actions. The CIP is divided into the following sections:

- Site description and history;
- Community profile and key community concerns;
- Highlights of the community involvement program;

recycled paper
05:ZJ6902_C9528-06/21/95-F1
ecology and environment

- Community involvement activities; and
- Attachments: List of contacts and interested parties, suggested locations for information repositories and meeting places, and the glossary.

1.2 THE SUPERFUND PROCESS

In 1980, the U.S. Congress enacted the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as "Superfund." The law established a program for investigating and cleaning up actual or potential releases of hazardous substances at sites throughout the United States. In 1986, Congress reauthorized CERCLA by passing the Superfund Amendments and Reauthorization Act (SARA). Among other changes, Congress increased the size of the cleanup fund from $1.6 billion to $8.5 billion.

The Superfund process requires EPA to conduct six major activities. The first activity is to identify hazardous waste sites that pose a threat to human health and the environment. The second activity involves a preliminary investigation of the actual or potential impact of the site. This investigation includes a review of the site historical files and collection and analysis of site samples for hazardous materials. At this point, EPA may decide to speed up the process by involving its emergency response program to eliminate any immediate threats to the public or the environment as is the case at Penta Wood Products. If this type of cleanup takes care of the problem, it may not be necessary to do the remaining activities. However, if a long-term cleanup is needed, EPA may proceed with the traditional Superfund process by going on to the third activity. This involves evaluating the collected analytical data by using a process called the Hazard Ranking System (HRS), and arriving at a single number, or score, that represents the relative threat or potential threat of the site. Sites that have a score of 28.5 or greater can be placed on the **National Priorities List (NPL)**, which is a prioritized listing of contaminated sites.

The fourth activity involves conducting an RI/FS. The RI/FS characterizes the nature and extent of contamination at the site, describes the extent of the threat to human health and the environment, and recommends a remedy for the site. At any time during the Superfund process, EPA may conduct an emergency response action if site contamination is found to be an immediate threat to public health or the environment.

Selecting a final remedy is the fifth activity in the Superfund process. Before selecting a final remedy, EPA will present a proposed plan and ask the public for comments.

Only after reviewing all public comments will EPA select a final remedy. When a final remedy is chosen, a **Record of Decision (ROD)** will be published to document the remedy and explain why it was selected over the other options. A responsiveness summary will be included in the ROD.

The sixth step of the Superfund process is the **Remedial Design/Remedial Action (RD/RA)**. The RD details the plans for the final remedy, and the RA implements the actual cleanup plan. Community involvement activities typically take place throughout the process.

EPA has identified **potentially responsible parties (PRPs)** who contributed to the contamination at the Penta Wood Products site. None of these PRPs agreed to conduct and fund investigation and removal activities, so EPA will clean up the site.

This CIP outlines activities that will help keep the public informed of actions concerning the Penta Wood Products Superfund site, and help encourage community input into the remedy-selection process.

ecology and environment

2. SITE DESCRIPTION

The Penta Wood Products site is located in Burnett County, approximately 2 miles west of Siren, Wisconsin, in the unincorporated Town of Daniels (see Figure 2-1). The Penta Wood Products site consists of a former wood-treatment facility. The site encompasses 114 acres, approximately 80 of which are known to be contaminated with chemicals that were used in the wood-treatment processes. The site also includes several buildings that were used for wood-treating operations and for storing and processing chemicals.

Penta Wood Products operated as a wood-treating facility from 1953 through May 1992. The facility treated wooden posts and poles for the telecommunications and utilities industries. Two treatment solutions were used: **pentachlorophenol (PCP)** and **ammoniacal copper zinc arsenate (ACZA)**, both of which contain hazardous substances. Wastes from the treatment process were generally disposed of on site. Contaminated wastewater was dumped into two lagoons and onto a woodchip pile at the northwest edge of the site.

In 1986, the Wisconsin Department of Natural Resources (WDNR) investigated operations at Penta Wood Products, where a number of chemical spills had reportedly occurred. A 1988 investigation found that ground water at the facility was contaminated with PCP. The facility was closed in May 1992, because of financial difficulties which prevented Penta Wood Products from complying with federal and state environmental regulations. In 1993, WDNR referred the site to EPA.

In April 1993, EPA did an assessment of the Penta Wood Products site. Results of this assessment showed high levels of **arsenic**, copper, and PCP in the soil. All of these substances are considered hazardous, according to federal regulations. On the basis of the site assessment findings, EPA estimated that as much as 110,000 cubic yards of soil had been contaminated with PCP, ACZA or a combination of them as a result of site operations.

recycled paper
05:ZJ6902_C9528-06/21/95-F1

During the site assessment, EPA also found storage tanks, drums, and open vats containing hazardous substances that had been abandoned at the site. In conjunction with the site assessment, EPA conducted a study of area ground water, collecting soil and ground-water samples. These sampling results confirmed that ground water was contaminated with chemicals used in the wood-treatment process at the site.

Because of the ground-water contamination documented in the WDNR and EPA investigations, the soil contamination documented in the site assessment, and the lack of security at the site, EPA determined that the Penta Wood Products site was a threat to public health and safety. In addition, the potential for further off-site movement of contaminants also presented a threat to the surrounding environment, especially to the nearby wetlands. In response to these potential threats, EPA began cleanup activities in April 1994.

Phase I of the EPA removal action took steps to reduce further contamination of soils, surface water, or ground water. Initial cleanup actions consisted of collecting liquid hazardous materials and packing them in safe containers until they could be disposed of off site. PCP-contaminated liquids and oils were pumped from the storage tanks and vats into secure tanks. PCP-contaminated sludge was removed from tanks and placed into drums. Laboratory chemicals were inventoried and placed in secure containers.

EPA identified 28 storage tanks at the site, including several underground storage tanks (USTs). The tanks contained PCP-contaminated oil and sludge, ACZA-contaminated liquid and sludge, and mixed PCP/ACZA-contaminated liquids and sludge. From May through early September 1994, workers removed the materials from the tanks, and placed them into drums for off-site disposal. USTs were excavated from the ground as they were emptied, and the holes were filled in. By September 1994, approximately 350 drums of PCP sludge and 24,000 gallons of PCP oil and liquid had been removed. The emptied metal storage tanks were cleaned, or "decontaminated," using a high-pressure steam wash, and cut up for scrap metal. Piping from the tanks was also decontaminated and salvaged. EPA refurbished an on-site biological water treatment system to remove the PCP from the wash water. The treated water was then pumped to a storage tank and reused as clean wash water. The system began operating in late May, eventually treating more than 87,000 gallons of water. Water was regularly sampled before and after treatment to verify that the system was removing the PCP.

Approximately 43,000 gallons of PCP oil and sludge were removed from the site for incineration from May to August. Some storage tanks contained usable products, including 12,000 gallons of ACZA solution, which was shipped to a local wood-treatment facility for use. Approximately 4,000 cubic yards of ACZA-contaminated soil was excavated and safely stockpiled on site. This soil was mixed with concrete and used to build a concrete "pad" for treatment of PCP-contaminated soil. The removal will continue, pending fund approval.

During the removal action, EPA set up several **bioremediation** test mixtures to treat the PCP-contaminated soil at the Penta Wood Products site. A report on the test results and EPA recommendations will be available to the public. Other treatment technology evaluations will also be considered. EPA will then develop a ROD specifying the cleanup(s) to be done at the site.

3. COMMUNITY BACKGROUND

3.1 COMMUNITY PROFILE

The town of Daniels is located in a rural area of Burnett County in northwest Wisconsin. In 1865, the current town of Daniels was originally part of Burnett County because there was only one township. Ten years later, three separate towns were formed, and Daniels became part of the town of Wood Lake. In 1907, the name was changed to Daniels which included part of what is now the town of Siren. In 1918, the boundaries were changed again and the county divided all towns into 36 square-mile sections, each of which contains 640 acres.

The Penta Wood Products site encompasses approximately 114 acres, and is located in the town of Daniels approximately 2 miles west of the town of Siren on Highway 70. The site is surrounded on all sides by wooded, residential/agricultural areas. Several small lakes (Doctor Lake, Big Doctor Lake, Crooked Lake, Fish Lake), wetlands, and the Amsterdam Sloughs Wildlife Reserve are located to the north and northeast of the site. To the south and southwest there are several small lakes, Dunham Lake, Mudhen Lake, and a pond.

The land, lakes, and rivers attracted early settlers to the area, including hunters, fishermen, dairy farmers, and loggers. Cut logs were transported via waterways and processed into lumber in the small sawmills in the area for construction of houses, schools, and other buildings. The community established the first post office and school in the Mudhen Lake area in the late 1800s. When the school closed in 1920, the children were bused to the school in Siren. Residents had to travel to St. Croix Falls for goods and services and to pay taxes. Most businesses in the area did not grow until the mid-1900s, and most residents still commute to neighboring towns for employment. Today, manufacturing plants,

recycled paper

retail services, government agencies, and schools employ a large percentage of the area's residents.

Relative to other counties in the state, however, Burnett County is categorized as a low-income bracket area based on employment opportunities and average wages paid. In 1990, the town of Daniels had a population of 602 residents. A large percentage of the residents are retirees, and others are second-home owners from outside the area. While some of these residents sustain a living from farming, most are dependent on manufacturing, retail, and service jobs in the surrounding townships.

Like much of Wisconsin, tourism is a significant economic factor in Burnett County, and the rivers, lakes, forests, and wildlife are some of Burnett County's attractions. In 1961, Wisconsin's Governor Gaylord Nelson established the Outdoor Recreation Act, which pledged millions of dollars toward environmental planning and land acquisition to ensure continued scenic values along state highways. Preservation of natural attractions in Burnett County led to economic development with an emphasis upon serving tourists and vacationers. In 1993, the county estimated its summer population at 40,530 compared to a base of 13,084.

3.2 CHRONOLOGY OF COMMUNITY INVOLVEMENT

Based on interviews conducted in the area, residents believe that the level of general community concern about the environment was heightened by the closure of Penta Wood Products in 1992. Most community members were unaware of the spills on the property and the effect such damage would have on the environment. Penta Wood Products had otherwise been considered a good neighbor and employer since 1953 to the town of Daniels and the surrounding communities. Although area residents were informed by EPA and WDNR of contaminated soil and ground water on the property, the closing of the facility was primarily an economic issue centering on concerns with regard to loss of revenue and employment.

Local press coverage was limited to the closure events of the Penta Wood Products facility until the EPA removal action began in early 1994. EPA mailed a fact sheet in March 1994 to area residents and local officials summarizing the site history, contamination, and human health and environmental concerns. EPA and WDNR held a public meeting on March 29, 1994, at the Burnett County Government Center in Siren. Forty-eight citizens registered as attendees at the meeting. On April 6, 1994, the *Inter-County Leader* ran a full 1.5 page story titled "Superfund Cleanup Begins at Penta." The article addressed the background,

cleanup, health risks, environmental and public concerns. The public was concerned about why it took so long to begin cleanup; the expense involved and who would be responsible for it; and questioned the seriousness of the pollution at the facility.

A second fact sheet was mailed out to area residents in May 1994, addressing progress made at the site and ongoing cleanup activities. After EPA created a large concrete pad for the bioremediation process, the *Burnett County Sentinel* ran a story on August 24, 1994, titled "EPA Builds Cleanup Pad at Penta Wood." The *Inter-County Leader* ran a similar story. Both articles informed the public that contaminated soil was used to make the concrete pad, which would, in turn, eventually be used in the treatment of the PCP-contaminated soil.

A third fact sheet was mailed in November 1994, summarizing the site history and EPA involvement for Phase I and Phase II activities. A second public meeting was publicized on November 23, 1994, in both local newspapers and the meeting was held at the Burnett County Government Center on November 30, 1994. Five citizens registered as attendees at this meeting.

In April 1995, EPA conducted informal interviews over a 2-day period to re-evaluate citizen concerns. Twenty-six residents and local officials from the area discussed their concerns for this CIP.

3.3 COMMUNITY CONCERNS

EPA interviewed residents and local environmental, health, and officials from the Town of Daniels and nearby Grantsburg, Siren and Webster. All of the residents interviewed were aware of the potential risks posed by the site and most had attended a public meeting, received an EPA fact sheet, or read an article in the local newspaper about the site. Currently, community concerns about the Penta Wood Products site are:

- Health hazards associated with the site;
- Contaminated ground water from the site getting into drinking water wells, lakes and rivers;
- Future use of the land and the buildings on the site;
- The cost and who will be paying for the cleanup;
- The relocation of Highway 70 in connection with the site; and

recycled paper
05:ZJ6902_C9528-06/21/95-F1

- The desire for updated information about specific EPA activities to clean up the site soil and ground water.

The residents interviewed were interested in the environmental and health hazards apparent at the site. However, most residents considered the shut down of Penta Wood Products as a loss because it was a part of the community for many years. Community concerns about the seriousness of the health hazards seemed to be overshadowed by this tie to the company.

One likely positive result of the removal action completed by EPA is that it may cause members of the community to believe that the long-term problems at the Penta Wood Products site can be solved and are worthy of being addressed further. It is important to anticipate this potential for renewed community interest. The following specific concerns, voiced during community interviews, are likely to become more apparent as the site cleanup progresses and is completed:

Health Concerns: The health risks were downplayed by residents due to the small size of the community and the past employment of many community members by the Penta Wood Products facility. Although most people knew the owner or someone else in the area who worked at Penta Wood Products, few residents knew anyone with an illness related to the site. Many of the site's immediate neighbors believed that the facility was unjustly shut down, regardless of the health risks that are known today. Most residents believed that Penta Wood Products was a good neighbor while it was in operation, even though the facility apparently did not consider the future consequences of its dumping practices.

Effect on Ground Water: Few residents living adjacent to the site were concerned about what substances were dumped on the site soils, how far the contamination has spread, and how it has affected ground water. All residents adjacent to the site obtain drinking water from private wells. A few of these residents have had their wells tested, and although they are not concerned about adverse health effects at this time, would like their wells tested periodically.

Officials from the Burnett County Land Conservation Department and Health Department were also interviewed. The Land Conservation Department was particularly concerned about ground-water quality as well as the site's potential influence on Doctor Lake,

a neighboring marshland, and residential drinking-water wells. Both departments believe the community should be kept informed as results come in during the investigation, especially if ground water and the lake are found to be contaminated. Although the officials realized that the public needs to be informed about the cleanup's progress, they also believed the community is more interested in the land use after the cleanup is complete.

Future Land Use: The closure of Penta Wood Products was an issue among the residents. They said the existing buildings are an eyesore and should be removed as part of the cleanup. The majority of the residents were curious about future land-use opportunities when the cleanup is complete. Some residents would like to see a forest restoration project take place; however, a few residents thought another industrial use would be appropriate. Other concerns noted were the concrete pad constructed for the bioremediation process and the fences put up to prevent people from entering the site. Most people wanted these removed after the cleanup is complete.

Economic Concerns: Some of the local officials interviewed believed that while Burnett County residents are generally inclined to be active participants in the process, residents' interests and concerns about the site are not primarily health related. Local residents were concerned about the appearance of the site from the standpoint of attracting tourists to the area's hunting, fishing, and other recreational sports businesses. Local officials also believed the residents' concerns are economic, related to the loss of jobs and local tax revenues since the facility closed. While Penta Wood Products was in operation, it employed approximately 30 workers, who contributed to the overall local economy, and the business taxes paid by the facility went to local school districts as well as other community projects.

Relocation of Highway 70: Local officials and residents said state agencies, especially WDNR and the Wisconsin Department of Transportation (WDOT), have not made sound decisions regarding land use and roadway improvements around the site. One major concern, especially for the neighboring residents, is the relocation of Highway 70. Since WDOT detected contaminated soil along this roadway adjacent to the Penta Wood Products site, WDOT apparently wanted to avoid responsibility for environmental problems related to the site when planning the relocation of the highway, according to some local officials. It was

decided that the highway would be rerouted through several parcels of private property. The owners of these parcels are upset and bitter that their hunting, grazing, and farm land will be absorbed with little or no compensation to them. They said they resented the fact that these state agencies cannot work together with EPA now that the Penta Wood Products site is being cleaned up. They also said the highway could remain in its present location if the departments would make an effort to communicate. Additionally, because of WDOT's decision to relocate the highway, the current road would have to be maintained by the county, and residents believed this is an additional burden to the community.

Need For Additional Information: The majority of individuals interviewed stated that they would like to receive more information on site activities from the governmental agencies, especially EPA, through a community mailing. They expressed an interest in semiannual updates on site activities. Some said they would attend future public meetings; many others said they would not as the first meeting they attended satisfied their curiosity. Officials from the local townships said they would like more detailed, technical information about PCP and arsenic, as well as the bioremediation process. Some residents said general information, such as in previous mailings, would be adequate. Residents would also like concise answers to the questions and concerns they have regarding future site use and the levels of ground-water contamination. It was suggested by one official that a preliminary meeting be held by local residents and officials prior to an EPA general public meeting to generate a list of questions they would like answered.

In general, community members do not appear to be knowledgeable about Superfund or its removal program, and have very limited awareness of the enforcement process and its technical and legal requirements. They also had difficulty distinguishing between EPA and other federal agencies, and between EPA and other state agencies.

4. GOALS OF THE COMMUNITY INVOLVEMENT PROGRAM

The community involvement program for the Penta Wood Products site is designed to provide opportunities for the community to learn about and participate in the Superfund process.

The community involvement program at the Penta Wood Products site will take the following approaches:

a. Educate area residents and local officials about the procedures, policies, and requirements of the Superfund program. An effort will be made to circulate basic information to the community describing the Superfund process. This information will be presented at public meetings and will be available in the information repositories.

Area residents will be informed about the interrelationship between other governmental agencies and the EPA in the Superfund process. The public will also be informed about the activities of other involved agencies, such as the Agency for Toxic Substances and Disease Registry (ATSDR), which assists EPA in evaluating the health risks associated with exposure to various hazardous substances.

b. Provide information on significant site developments and investigation results to area residents. Information will be made available to area residents explaining significant results of the RI/FS. This reporting of site developments will be accomplished through the distribution of site update reports and fact sheets.

c. Monitor the level of community concern. The arrival of investigation teams may trigger increased attention and discussions regarding the site and surrounding area. Com-

munity interest and concern may intensify once the RI/FS is initiated. Throughout the RI/FS process, EPA will maintain contact with residents, local officials, and other interested parties, and will attempt to assess changes in concerns or level of interest regarding the site.

d. Enlist the support and participation of local officials and key community contacts in coordinating community involvement activities. Throughout the RI/FS, it will be important to maintain contact with the town chairman and other local officials and key members of the community. Local officials and community contacts are an invaluable resource in EPA's effort to understand and monitor the community's concerns.

e. Provide officials with detailed technical information about PCP arsenic, the remediation process and site investigation and cleanup activities. Maintain personal contact whenever possible (i.e., informal site tours, small group meetings, home visits).

5. COMMUNITY INVOLVEMENT ACTIVITIES

The following activities are planned for the Penta Wood Products site community involvement program. Figure 5-1 illustrates the approximate timing of each activity during the cleanup schedule for the site.

a. Establish an information contact: The designated EPA Region V community involvement coordinator is Susan Pastor. She is responsible for responding to inquiries from the public and media representatives regarding site activities.

b. Establish and maintain information repositories: The CIP, fact sheets, site update reports, technical reports, and information on the Superfund program will be placed in information repositories. The addresses and phone numbers of the information repositories are listed in Attachment B.

c. Prepare fact sheets and site update reports: Fact sheets were released during removal activities to inform citizens about EPA's cleanup. Other fact sheets or updates will be prepared to explain findings of the RI, and to outline long-term cleanup options considered for the Penta Wood Products site. A summary of EPA's recommended alternative(s) will be provided in an easy-to-read fact sheet called a proposed plan when the FS is complete.

d. Provide press releases to local media: Prepared statements will be released to local TV and radio stations, and to newspapers to notify the community of public meetings,

requests for public comments, and other significant site-related events. Addresses and phone numbers of local media are included in Attachment A.

e. Public meetings: Public meetings or informal open-house-style availability sessions will be scheduled periodically to inform the community of on-site activities and/or results and findings from the ongoing investigation. Meetings will cover removal and RI progress as well as EPA's proposed plan for addressing site contamination. Public comments on the proposed plan will be solicited.

A recommended location for meetings is the Burnett County Government Center in Siren. Meetings will be advertised in the *Burnett County Sentinel* and the *Inter-County Leader*. The address and phone number of the Burnett County Government Center are included in Attachment B.

f. Public comment period: A minimum 30-day public comment period will be held following the completion of the FS and proposed plan to allow citizens to provide input on EPA's recommended alternative for long-term cleanup action at the Penta Wood Products site.

People on EPA's site mailing list will receive the proposed plan. EPA will hold a public meeting where a court reporter will document the proceedings and prepare a verbatim transcript of the meeting. Community input will be encouraged during the public comment period. Comments will be taken in written or verbal form and will be addressed in a document called a "responsiveness summary," which will be attached to the ROD.

Upon selection of the final cleanup plan, EPA will begin RD/RA activities. A public meeting may be held to introduce this phase.

g. Involve community leaders: EPA will keep local officials informed as much as possible. Throughout the process EPA will share plans, results and other reports, as well as seek input. While in the Daniels/Siren area, EPA staff will attempt to personally contact and/or meet with local officials to provide informal site updates whenever possible.

h. Inform community about Technical Assistance Grants (TAGs): TAGs provide community groups with up to $50,000 for hiring technical advisors to help communities understand site-related information. Groups receiving TAGs must contribute 20 percent of the

total project costs through cash, donated supplies or volunteered services. PRPs, academic institutions, political subdivisions and groups supported by government are not eligible. TAGs may be awarded to groups near sites on, or proposed for the NPL. When Penta Wood Products is proposed for the NPL, U.S. EPA will inform citizens on the availability of a TAG. This will be done through mailings or at meetings.

Figure 5-1

OUTLINE OF COMMUNITY INVOLVEMENT ACTIVITIES

Community Involvement Activity	Technical Activity			
	Beginning of RI/FS	Completion of the RI	Completion of the FS Report/ Proposed Plan	Signing of Record of Decision
Establish Information Contact*	X	update as needed		
Informal Discussions with Local Officials and Residents	X			
Information Repositories*	X	update as needed

GLOSSARY

Ammoniacal Copper Zinc Arsenate (ACZA)	A wood preservative, also called "green treatment." It consists of an ammonia and water solution that carries the metals copper, zinc, and arsenic into the wood. When the ammonia evaporates, copper and zinc arsenates are left in the wood to prevent rotting. The most toxic effects from ACZA results from exposure to the arsenic in the mixture (see "arsenic" below).
Arsenic	A naturally occurring inorganic chemical used in insecticides and weed killers. Manufacturers use arsenic to make metals, glass and wood preservatives. Lumber may be treated with arsenic to make it resistant to rotting. Swallowing arsenic can cause skin, lung, liver and kidney cancer. Long-term exposure to arsenic may cause a darkening of the skin and the appearance of small "corns" or "warts" on the palms, soles, and torso. Such exposure can also affect the nervous system, causing a "pins and needles" sensation in the hands and feet.
Bioremediation	An engineered process that relies on microorganisms, such as bacteria or fungi, to transform hazardous chemicals into less toxic or nontoxic chemicals. The microorganisms live on carbon compounds in the organic chemicals, and, with the addition of a nutrient such as fertilizer, accelerate the degradation of hazardous chemicals.
National Priorities List (NPL)	A federal roster of uncontrolled hazardous waste sites that actually or potentially threaten human health or the environment and are eligible for investigation and cleanup under the federal Superfund program.
Pentachlorophenol (PCP)	A man-made substance that does not occur naturally in the environment. Its presence in the environment is the result of emissions from factories, hazardous waste sites, and other sources. PCP is used industrially as a wood preservative for power line poles, cross arms, fence posts, etc. When used as a preservative, PCP is dissolved in fuel oil. PCP can enter the body through inhalation, ingestion, and dermally. Human exposure may result in adverse effects to the liver, kidneys, skin, blood, lungs, and nervous system. Long-term exposure may result in an increased cancer risk.

Potentially Responsible Party (PRP)	Any individual(s) or company(s)—such as owners, operators, transporters, or generators—potentially responsible for, or contributing to, the contamination problems at a Superfund site. Whenever possible, EPA requires PRPs, through administrative and legal actions, to clean up hazardous waste sites for which they have a legal responsibility.
Record of Decision (ROD)	An EPA document issued after the RI/FS that sets forth the selected cleanup remedy for a site.
Remedial Design and Remedial Action (RD/RA)	A phase of the Superfund process which follows the Remedial Investigation and Feasibility Study (RI/FS). The Remedial Design involves the development of engineering drawings and specifications for a site cleanup. The Remedial Action is the actual cleanup to stop or substantially reduce a release or threat of release of hazardous substances that is a serious but not an immediate threat to public health and the environment.
Remedial Investigation/ Feasibility Study (RI/FS)	A two-part study of a Superfund site that must be completed before a cleanup can begin. The first part, the Remedial Investigation, determines the nature and extent of contamination at a Superfund site. The second part, the Feasibility Study, evaluates several alternatives (including no action) that are designed to address the problems identified during the Remedial Investigation.
Superfund	The common name used for the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The Superfund Amendments and Reauthorization Act (SARA) was passed by Congress in 1986 to update and improve CERCLA. Superfund authorizes the federal government to respond directly to releases, or threatened releases, of hazardous substances that may endanger public health, welfare, or the environment. CERCLA established a $1.6 billion Hazardous Waste Trust Fund made up of taxes on crude oil and commercial chemicals. When Superfund was reauthorized by Congress in 1986, the fund was increased to $8.5 billion. EPA is responsible for managing the Superfund program.
