Good afternoon Joe-
We wanted to provide an end-of-year update regarding the identified sheen at the C. Reiss Dock Property in Superior, Wisconsin.

Since our last update, provided via email on November 27, 2024, Stantec personnel have visited the site to document conditions in the vicinity of the identified sheen and check if a sheen remained evident. Since the November 27th update, weather conditions in the region have been below freezing. During a December 3rd visit, only ice was present in the ditch. No flowing water or sheen was observed. However, a small, stained area, generally located at Station 16+00, was observed along the toe of the berm (see photo below). The stained area is consistent with the location of the sheen observed during prior site visits. There were no changes to this area during a subsequent site visit on December 16th.

We intend to continue intermittent passive observations during the winter months (i.e., frozen conditions) and will take a more active approach to observations of Station 16+00 during thaw conditions or the spring of 2025.

Also, we are nearing completion of a Post-Construction Documentation Report which summarizes construction and sampling activities performed concurrently with recent site redevelopment. We intend to provide this document to you for review early in the New Year.

In the interim, please let us know if you have any questions. Happy holidays!
