Dear Ms. Winkler:

Stantec Consulting Services Inc. (Stantec [formerly Bonestroo]) was contracted by Oconto Electric Cooperative to perform water quality monitoring on the Stiles Hydroelectric Dam. The water quality monitoring was conducted to determine if FERC water quality standard regulations are being achieved in the discharge downstream of the dam. Water temperature, dissolved oxygen (DO) and pH data were collected on an hourly basis (24 measurements per day, per location) from June 1, 2011 through August 31, 2011 using portable, water quality monitoring equipment. The data was collected at two sites along the Oconto River, one located upstream of the Stiles dam and the other located downstream of the dam. The following report details the results of the water quality monitoring.

The WDNR has classified the Oconto River immediately downstream of the Stiles Hydroelectric Dam as a warm water sport fish community and therefore must be monitored per FERC guidelines to ensure sustained water quality. FERC regulates that for warm water fish the water temperature must not exceed 89° F, dissolved oxygen (DO) concentration must not be less than 5.0 milligrams per liter (mg/L) and that pH must be within the range of 6.0 to 9.0 with no change greater than 0.5 units outside the estimated natural seasonal maximum and minimum.

Oconto Electric requested that Stantec staff utilize the two existing monitoring points to complete the water quality surveying. The point upstream of the dam was located on the southern inflow wall of the hydroelectric dam. The second monitoring well was located on the south bank of the Oconto River approximately 500 feet downstream of the dam. The monitoring points consisted of 4-inch diameter PVC approximately 15 feet in length. The monitoring points were located within the bed of the Oconto River as shown on the attached map.

The monitoring equipment used for this project was two YSI 600XML V2 portable Sonde. The Sonde units recorded data electronically on an hourly basis throughout the monitoring period. In compliance with FERC parameters, the monitoring equipment was calibrated for pH and DO prior to use in the Stiles Dam water quality monitoring. The two Sondes were calibrated on May 31, 2011 before the water quality monitoring began, once on July 12, 2011 during the water quality monitoring and again on August 31, 2011 after the water quality monitoring was completed. No calibration corrections needed to be made due to the fact that there was no loss of calibration greater than 0.20 mg/L (Appendix A). DO measurements were recorded with a self-cleaning optical DO sensor which was specifically designed to prevent biofouling.

The instrument used to collect the data upstream of the dam malfunctioned and stopped collecting data after the second collection time on August 24, 2011. As a result no data was collected from the upstream of dam location from August 24, 2011 through August 31, 2011.

The observed temperature upstream of the dam had a mean of 74.87°F with a high of 86.17°F and a low of 61.94°F. The median temperature upstream of the dam was 75.94°F and the mode was 78.67°F. The mean

temperature downstream of the dam was 72.96°F with a median of 73.58°F and a high of 88.6°F and low of 61.65°F. None of the monitoring results for either upstream or downstream were above the maximum allowed temperature of 89°F.

The mean pH level upstream of the dam was 7.83 with a median pH level of 7.85 and a mode of 7.88. The highest pH level recorded upstream of the dam was 8.25 and the lowest was 7.43. The mean pH level downstream of the dam was 8.06 with the median being 8.05 and the mode 7.95. The highest pH level recorded downstream of the dam was 8.82 and the lowest was 7.03. All of the recorded pH levels for upstream of and downstream of the dam fall within the FERC regulation levels of 6.0 to 9.0.

The mean DO concentration upstream of the dam was 5.67 mg/L. The median and mode DO concentrations upstream of the dam were 5.74 mg/L and 6.00 mg/L with a high of 8.16 mg/L and a low of 3.01 mg/L. The mean DO concentration downstream of the dam was 6.66 mg/L with a median and mode of 6.51 mg/L and 6.37 mg/L. The highest DO concentration recorded downstream of the dam was 11.41 mg/L and the lowest was 2.74 mg/L. Deviations in the DO readings are discussed in more detail below. Refer to the graphs in Appendix A for more information.

The data above is summarized in the following table:

	Temperature Mean	High Temperature	Low Temperature	pH Mean	High pH	Low pH	DO Mean	DO High	DO Low
Upstream of the Dam	74.87°F	86.17°F	61.94°F	7.83	8.25	7.43	5.67 mg/L	8.16 mg/L	3.01 mg/L
Downstream of the Dam	72.96°F	88.6°F	61.65°F	8.06	8.82	7.03	6.66 mg/L	11.41 mg/L	2.74 mg/L

SUMMARY

Temperate and pH water quality data collected during the monitoring period fell within the FERC water quality license guidelines for the upstream and downstream data points. However, DO concentrations fell below the specified limit of 5.0 mg/L on 16 different days between June and July downstream of the dam. Of these 16 days, six days were out of compliance for 1 or 2 hours total while the remainder of the DO measurements were above 5 mg/L. The other 9 days recorded DO concentrations below 5 mg/L for more than 3 hours each day. The low DO levels were observed from June 29 through July 6 and July 23. The hydroelectric facility decreased its daily released volume of water in early July which caused the water level downstream of the dam to drop. The low water levels resulted in the Sonde probe that recorded DO to be partially out of the water for brief periods of time. The Sonde was therefore recording oxygen levels more representative of atmospheric rather than DO. Once the problem was observed, Stantec lengthened the safety cord attached to the probe, resulting in more probe being consistently submerged. The low DO levels recorded below the dam through the monitoring period typically corresponded with similarly low DO levels from the monitoring point above the dam. Last, a small diurnal fluctuation was observed in the DO readings below the dam indicating that an algae bloom was negatively affecting the concentrations.

Low DO levels (i.e. <5 mg/L) were recorded on 35 days throughout June, July, and August upstream of the dam. These low DO levels in the flowage above the dam can be correlated to an increase in water temperature and an overall low water quality that was recorded by Wisconsin Department of Natural Resources. WDNR documented a large algae bloom in the flowage that caused low DO from July 1 through

November 11, 2011

August 3, 2011. Diurnal variations in the DO were observed above the dam which indicates algae was present in the flowage. The presence of an algae bloom is further supported by the high chlorophyll a and phosphorus measurements and high water temperatures. Chlorophyll a readings in the lake were recorded as the highest since 1994. Water quality in the flowage above the dam was also impacted by the presence of a local waste water treatment plant, paper mill, and non-point source pollution (i.e. agricultural run-off). WDNR data was obtained at:

<http://prodoasjava.dnr.wi.gov/swims/public/reporting.do?type=10&action=post&stationNo=433123&year1=2011&format=html>

This increase in water temperature coupled with high nutrient loading in the flowage would be expected to decrease DO. DO readings in mid-summer may also have been impacted by the location of the monitoring device. The upstream monitoring location is located in close proximity to the dam, which draws its discharge water from the surface of the water body. Since the probe is located several feet below the water surface, stagnated water could collect directly adjacent to the dam in low flow conditions; thereby reducing DO concentrations.

CONCLUSIONS

Temperate and pH water quality data collected during the monitoring period fell within the FERC water quality license guidelines for the upstream and downstream data points. DO concentrations below the FERC guidelines were recorded both above the dam (in the flowage) and downstream of the dam. DO concentrations in the upstream flowage were impacted by discharges from industrial facilities, agricultural run-off and high aquatic plant growth.

Concentrations of DO downstream of the dam were typically linked to the DO concentrations in the flowage. For a majority of days when DO was below FERC guidelines, DO concentrations upstream in the flowage were correspondingly low. Low DO's below the dam also were consistent with a slight increase in water temperature coupled with elevated nutrient loading and subsequent algae growth. Overall with the exceptions noted above, water quality measurements were in compliance with the FERC guidelines for majority of the monitoring period.

We trust this information meets your needs. Thank you for the opportunity to work on this project. If you have any questions please feel free to contact Susan Knabe at 920-592-8400 or susan.knabe@stantec.com or John Wiater at 920-592-8400 or john.wiater@stantec.com.

Respectfully,

STANTEC CONSULTING SERVICES INC.

	8/31/2011	Optical DO % sat.	Oconto Above	100	761.5
	8/31/2011	pH (4.0)	Oconto Below	4.09	761.5
	8/31/2011	pH (7.0)	Oconto Below	7.01	761.5
	8/31/2011	pH (10.0)	Oconto Below	10.09	761.5
	8/31/2011	Conductivity	Oconto Below	1414	761.5
	8/31/2011	Optical DO % sat.	Oconto Below	101	761.5

Calibration Standards:

pH 4.0 at 25°C
 7.0 at 25°C
 10.0 at 25°C

Conductivity 1409 umhos/cm at 25oC

ODO %sat. calculated in water saturated air with NOAA barametric pressure
 conversion for 581.1 ft. above see level (Green Bay)
