

## **Mississippi River Water Quality Surveys and Reports (1986-1997)**

**Mississippi/Lower St. Croix Team  
Wisconsin Department of Natural Resources  
La Crosse, WI  
June 1997**

The attached information summarizes monitoring activities and reports conducted or supported by the Mississippi River Water Quality Specialist position over the last 10 years. This information was prepared to document past monitoring efforts, to help organize data files (both electronic and hard copy) and to facilitate information sharing with other interested parties. This summary will also assist our Department in the development of future Mississippi River water quality work plans or monitoring program activities. This summary does not include monitoring activities undertaken by the Department's Resource Trend Analysis field station located at Onalaska, WI. This field station is federally funded and concentrates its efforts primarily on Pool 8 of the Mississippi River.

Table 1 provides a listing of monitoring surveys conducted by navigational pool and year from February 1986 to March 1997. Monitoring survey types include: general limnological, continuous monitoring, flow gaging, sediment sampling, dye tracing, invertebrate sampling, bathymetry surveys, chemical sampling and stage level measurements. A majority of this information has been collected as part of problem assessment monitoring (i.e. condition monitoring) for the federal Environmental Management Plan (EMP) - Habitat Rehabilitation and Enhancement Program (HREP). Once a habitat project has been completed, the monitoring purpose is to evaluate the effectiveness of the project to see if the project's water quality objectives have been met. This latter work is currently being undertaken as part of a 10-year evaluation of the federal EMP program.

The main monitoring purposes include:

**Condition** - These surveys are conducted to assess general water quality (dissolved oxygen) or physical conditions (depth, flow, temperature and light penetration) in various habitats of the Mississippi River. A majority of this work has been directed at providing the necessary information to help support or advance habitat rehabilitation projects on the river.

**Dredging Evaluation**- This information includes sediment sampling and water quality surveys conducted to assess Mississippi River dredging projects. The purpose of this work is to obtain site specific information to approve dredging projects or to evaluate compliance with dredging permits issued through Chapter 30 permits or our Water Quality Certification program.

**HREP**- This monitoring activity is focused on Habitat Rehabilitation Enhancement Project monitoring to evaluate the water quality response to dredging, flow diversions, flow isolation, drawdowns, and island creations as part of the federal Environmental Management Program.

**Point Source Evaluation** - These surveys are conducted near point source discharges to the Mississippi River. The purpose of this work is to assess water quality problems that could be caused by point source discharges of pollutants to the Mississippi River. In addition, site specific information is collected to assist in the development of wastewater discharge permits to ensure compliance with Wisconsin's water quality standards.

**Resource Analysis Program**- The purpose of this monitoring activity is specific to Weaver Bottoms, Pool 5. This activity is part of a 10-year multi-agency monitoring effort to evaluate side channel modifications and island construction in a large backwater area of Pool 5. This program pre-dates the EMP-HREP program and is part of the channel maintenance activities by the St. Paul Corps of Engineers.

**Stream Classification**- These surveys evaluate the receiving waters for Wisconsin point source dischargers directly to the Mississippi River or its backwaters. This information is necessary for the issuance of wastewater discharge permits by our Department. The information includes an assessment of the biological resources and potential water quality of the receiving water area.

**Trend** - The purpose of trend monitoring is to assess long term water quality (including suspended and bed sediments) changes at specific locations in the Mississippi River. This includes the Department's ambient water quality monitoring stations at the Lock and Dams that started in the 1960s to 70s and the more recent multi-agency invertebrate surveys on Pools 2 to 13 and the Department's sediment trap invertebrate colonization studies at L/D 3 and 4.

Numerous summary reports have been prepared that describe in detail the various monitoring activities summarized in Table 1. A listing of these reports (by year) is attached.

The information is stored in various formats (both electronic and hard copy) at the State Office Building in La Crosse. Specific requests for information should be directed to: John Sullivan, WDNR, 3550 Mormon Coulee Rd, La Crosse, WI 54601 (phone: 608-785-9995).

Table 1. Summary of monitoring surveys and data files compiled on the Mississippi River Water Quality Specialist, Wisconsin Department of Natural Resources, La Crosse, WI for the period 1986 to 1997.
