1. INTRODUCTION

Ramboll US Consulting, Inc. (Ramboll), on behalf of Marquette University (Marquette), has prepared this Supplemental Remediation Documentation and Progress Report (the “report”) for the former Taxman/One-Hour Valet Drycleaner Site (the “site”) located in Milwaukee, Wisconsin. The Wisconsin Department of Natural Resources (WDNR) Bureau of Remediation and Redevelopment Tracking System (BRRTS) has assigned the case number 02-41-152248 to the site. This report has been prepared in accordance with Wisconsin Administrative Code (WAC) Chapter NR 724 and documents post-remedial action monitoring activities and supplemental remedial amendment injection activities at the site. Parties currently involved with the project include the following:

Responsible Party/Site Owner:	Marquette University Mr. Joel Smullen, AIA 517 North 14th Street Milwaukee, WI 53233 (414) 288-4620
Regulatory Agency/Project Manager:	WDNR Mr. Isaac Ross 2300 North Dr. Martin Luther King, Jr. Drive Milwaukee, WI 53212-3128 (414) 263-8519
Environmental Consultant:	Ramboll US Consulting, Inc. Ms. Jeanne Tarvin, PG, CPG 234 West Florida Street, Fifth Floor Milwaukee, WI 53204 (262) 901-0085

1.1 Site Location and Description

The site is located at 1214-1222 West Wells Street in the southwest $\frac{1}{4}$ of the northwest $\frac{1}{4}$ of Section 29, Township 7 North, Range 22 East, City of Milwaukee, Milwaukee County, Wisconsin (Figure 1). The geographic position of the Site in WTM 91 (x,y) coordinates obtained from the WDNR Remediation and Redevelopment (RR) interaction site map (<http://dnrmmaps.wi.gov>) is 688795, 287401. The site includes two tax parcels in the City of Milwaukee, 3910218000 and 3910219100.

The site is bounded on the west by a public and Marquette parking structure, on the north by a hospital parking garage, on the east by North 12th Street, and on the south by West Wells Street, as shown on Figure 2. The site is currently owned by Marquette and is enrolled in the WDNR-administered Drycleaner Environmental Response Fund (DERF) Program. The former site buildings were demolished in 2018 in advance of the remedial action implementation activities and all associated utilities were disconnected. The balance of the paved surfaces was also removed in 2018 following implementation of the remedial actions.

The site slopes from the northwest to the east and south, resulting in storm water drainage toward North 12th Street and West Wells Street. The nearest surface water body is the Menomonee River, which is located approximately one-half mile to the south of the site. Potable water for the area is provided by the City of Milwaukee municipal water supply, the source of which is Lake Michigan.

1.2 Previous Remediation Activities

The site has been subject to several subsurface investigations since 1999. Following source area soil and groundwater investigation activities, a *Remedial Design Report* including evaluation of remedial action options (Ramboll, 2018) was prepared to document the technical basis, design, and implementation approach for the selected remedial option (*in-situ* enhanced reductive dechlorination [ERD]). The *Remedial Design Report* was approved by the WDNR, and soil and groundwater remediation activities were conducted in July 2018. Approximately 1,940 cubic yards of chlorinated volatile organic compound (CVOC) impacted soil and groundwater were treated using *in-situ* ERD soil blending by incorporating zerovalent iron (ZVI) and a carbon amendment (commercially known as Anaerobic BioChem [ABC®]). The soil blending was primarily focused on treating saturated soil and groundwater at depths below the former dry cleaner's basement floor. Following completion of the soil blending activities, the former basement void was backfilled with crushed concrete from the former site buildings. A *Remedial Action Documentation Report* (Ramboll, 2019) was submitted to the WDNR which documented the remediation activities and described the planned post-remediation monitoring including routine groundwater sampling and soil confirmation sampling. A *Post-Remedial Action Documentation Report* (Ramboll, 2020) was submitted to the WDNR which documented the post-remedial action activities, including site redevelopment and post remedial action activities (e.g., soil confirmation sampling, soil vapor sampling, and groundwater monitoring). Based on the residual COVC concentrations reported in a subset of the post-remedial action and groundwater samples collected, supplemental remedial actions were proposed to further enhance reductive dichlorination at the site. A work plan for performance of the supplemental *in-situ* ERD activities was included in the *Post-Remedial Action Documentation Report*.

1.3 Purpose of Report

The purpose of this report is to summarize and document the supplemental *in-situ* ERD activities and present the results of the October 2020 semi-annual groundwater monitoring event.

2. SUPPLEMENTAL *IN-SITU* ERD ACTIVITIES

The following section documents the field activities that were completed as part of the supplemental *in-situ* ERD activities completed in August/September 2020.

2.1 Subcontractor Identification

The following remedial service providers were utilized during the supplemental remedial activities:

***In-Situ* ERD Injection and Injection Well Installation**

Redox Tech, LLC (Redox Tech)
2609 Crooks Road, #204
Troy, MI 48084

Private Utility Locator

Subsurface Radar Solutions (SRS)
17750 Beaverton Road
Capron, IL 61012

2.2 Pre-Supplemental Injection Activities

2.2.1 Underground Injection Control (UIC) Permit

In accordance with the Wisconsin Pollutant Discharge Elimination System (WPDES) general permit requirements, a temporary exemption for injection in accordance with WAC NR 140.28(5) and approval to inject remedial materials under WAC NR 812.05 was requested and secured prior to completing injection activities. The permit application was submitted under separate cover to the WDNR on May 27, 2020 and approved on July 24, 2020.

2.2.2 Utility Locating

Prior to commencing the supplemental *in-situ* ERD activities, a request for public utility location services was filed with Wisconsin One-Call (Diggers Hotline) and SRS, a private utility locator, completed on-site utility locating services within the injection area.

2.3 Implementation of Supplemental Injection Activities

2.3.1 Chemical Amendment Application Activities and Injection Well Installation

To adequately provide supplemental chemical amendment to the previously treated July 2018 source area soils, injections were completed at nine boring locations on August 31 and September 1, 2020, utilizing a direct-push tooling (DPT) rig equipped with large diameter tooling. The injection locations were selected near soil confirmation borings C1, C2, C4, and C5 which exhibited elevated CVOC concentrations. Following completion of the injection activities, eight of the nine boring locations were completed with pre-packed 1-inch diameter wells of varying screen lengths in accordance with WAC NR 141 to allow for follow-up injections if needed at some point in the future. The injection locations (IP-1, IW-1 through IW-8) are shown on Figure 3. The injection well construction logs and *in-situ* ERD injection material quantities are presented in Appendix A. A discussion of the injection methodology is provided below.

Prior to well installation, abrupt elevated pressure techniques (fracturing) were applied to create fractures within the soil matrix across the treatment and proposed screened interval. Applied pressures ranged between 110 and 210 pounds per square inch (psi). Voids created during the fracturing were immediately occupied with an emulsion of fine-grain quartz sand, ZVI, carbon amendment, bioaugmentation microbial culture of KB-1 containing *Dehalococcoides* (*Dhc*) and deoxygenated potable water. Three of the injection borings (IW-6, IW-7, and IW-8) near soil confirmation boring C1 were fractured at six horizons at approximate discrete depths of 20, 22.5, 25, 27.5, 30, and 32.5 feet below ground surface (bgs). Fracture thicknesses were estimated to be approximately one-quarter inch and radiated approximately 7 to 8 feet from each boring location. Three injection borings (IW-3, IW-4, and IW-5) near soil confirmation boring C2 were fractured at three horizons at approximate depths of 25, 27.5, and 30 feet bgs. The remaining three injection borings (IW-1, IW-2 and IP-1) near soil confirmation borings C4 and C5 were fractured at two horizons at 13 and 15 feet bgs.

Each fracture interval received 20 gallons of an injectant mixture with a concentration of 1-gallon ABC® per 19 gallons water, 100 pounds ZVI, 100 pounds silica sand, and 0.1 kilogram of KB-1 bioaugmentation bacteria culture. The KB-1 bioaugmentation bacteria culture is a naturally occurring, non-pathogenic microbial culture that contains *Dhc*. *Dhc* is a group of microorganisms documented to promote the complete dechlorination of chlorinated ethenes to non-toxic ethene (Lu, 2006). The injection of *Dhc* is designed to replenish and increase the existing microbial colony. Estimated total amendment quantities applied during the injection well installation

activities were approximately 3,900 pounds of sand, 3,900 pounds of ZVI, 780 gallons of carbon amendment-water mixture, and 1 gallon of KB-1 bioaugmentation bacteria culture.

Following the application of the amendment in the induced fractures at each soil boring, DPT tooling was removed from the soil boring and decontaminated using potable water. Eight pre-packed wells were installed within the annulus of borings IW-1 through IW-8 and completed at the surface within a 6-inch diameter bolt-down type flush-mount well compartment secured in a concrete pad. One injection well was unable to be completed at boring IP-1 due to subsurface obstructions (e.g., crushed concrete material) at approximately 3 to 4 feet bgs. A borehole abandonment form is included in Appendix A. Soil cuttings were not generated during the well installation activities within the treated soil area due to the installation of pre-packed monitoring wells. Waste material was limited to surficial asphalt debris associated with the well compartment installation.

2.3.2 Potable Water Source and Use

During chemical amendment preparation potable water was used to create the aqueous ABC® solution. Water was obtained from a faucet located in the adjacent Marquette parking garage immediately west of the injection area. Potable water was deoxygenated prior to injection activities. Deoxygenation was completed by adding a combination of sugar and yeast or sodium sulfite. The volumes of deoxygenation chemicals used were based on the quantity of required deoxygenated water.

2.3.3 Injection Monitoring Activities

Surface materials (e.g., asphalt and vegetation) were visually monitored during injection activities. No remediation materials were observed at the surface during injection activities. Groundwater elevations were collected during injection activities and are tabled and presented in Appendix A.

2.4 Post-Injection Groundwater Monitoring Activities

An initial evaluation of post-supplemental amendment injection activities was conducted as part of the October 2020 semi-annual groundwater monitoring event. The October 2020 groundwater data is considered the baseline for evaluation of future amendment injection events, if warranted.

3. OCTOBER 2020 GROUNDWATER MONITORING ACTIVITES

The groundwater sampling activities were conducted utilizing the procedures and methodology specified in the *Remedial Design Report* (Ramboll, 2018) and *Remedial Action Documentation Report* (Ramboll, 2019). Additionally, the *Post-Remedial Action Documentation Report* (Ramboll, 2020) recommended a modification to the monitored natural attenuation (MNA) parameter list (eliminating nitrate, dissolved iron, and ferric iron), collecting MNA parameters from only PZ-1R, and modifying the groundwater monitoring program to a semi-annual basis. The resulting analytical data were reviewed, tabulated, and compared to WAC NR 140 Preventative Action Limits (PALs) and Enforcement Standards (ESs). The following sections document the initial post-supplemental amendment injection groundwater sampling event completed in October 2020.

3.1 Post-Supplemental Amendment Injection Groundwater Monitoring

Six monitoring wells (MW-4, MW-5, MW-6, PZ-1R, PZ-2R, and PZ-4) were sampled October 28, 2020, as part of the ongoing post-remediation low-flow groundwater monitoring program.

Monitoring well PZ-1R is a source area well and is located within the boundaries of the *in-situ* ERD

soil blending and supplement *in-situ* ERD injection activities. Monitoring well MW-4 is an upgradient monitoring well. The remaining monitoring wells are located downgradient of the source area. Groundwater monitoring well locations are included on Figure 2.

Groundwater samples collected from the six monitoring wells were submitted to a Wisconsin-certified laboratory for analysis of VOCs using United States Environmental Protection Agency (USEPA) Method 8260B. Monitoring well PZ-1R was also sampled for the following MNA parameters: ethane/ethene/methane (USEPA Method 8015), ferrous iron species (USEPA Method 3500), total organic carbon (USEPA Method 5310C), and sulfate (USEPA Method 300).

One quality assurance/quality control (QA/QC) duplicate groundwater sample and QA/QC laboratory trip blank sample were submitted for laboratory analysis as part of the groundwater sampling event. Field parameter measurements including dissolved oxygen (DO), oxidation-reduction potential (ORP), pH, specific conductivity, and temperature were also measured and recorded at each well during the sampling event.

3.2 Groundwater Elevation Measurements

To evaluate groundwater flow directions and hydraulic gradients, groundwater elevations were measured during the supplemental *in-situ* ERD injection activities (pre- and post-injection) and the October 2020 groundwater sampling event. A summary of historical groundwater elevations is presented in Table 1.

October 2020 groundwater elevations were generally lower when compared to previous site-wide groundwater sampling event completed in March 2020. The continued low levels observed in October 2020 could be associated with completion of the parking lot construction in July 2019.

A groundwater potentiometric surface map is provided as Figure 4. The inferred direction of groundwater flow across the site is generally toward the east-southeast, with the highest groundwater elevation observed in well MW-2 (near the northwest corner of the property) and the lowest groundwater elevation observed in MW-5 (eastern portion of the property). This interpretation of local groundwater flow direction is consistent with previous observations.

Horizontal and vertical gradients were evaluated between November 2017 and the post-remedial action groundwater sampling events beginning in August 2019. The measured horizontal hydraulic gradient between wells MW-2 and MW-5 was 0.043 foot per foot (ft/ft) in November 2017, 0.059 ft/ft in August 2019, 0.052 ft/ft in October 2019, 0.053 ft/ft in March 2020, and 0.048 ft/ft in October 2020. The horizontal gradients increased somewhat after the impervious surfaces were removed and after the July 2018 remedial action and appear to have decreased after the parking lot was constructed. The August/September 2020 supplemental injection activities did not adversely impact the horizontal gradient observed at the site.

Vertical hydraulic gradients were evaluated between wells MW-5 and PZ-4. Historical vertical gradients have all been downward and ranged from 0.56 ft/ft in November 2017 to 0.54 ft/ft in August 2019 and October 2020. The vertical hydraulic gradients have not been affected by the removal of the impervious surfaces or performance of the July 2018 remedial action and August/September 2020 supplemental injection activities. Horizontal and vertical hydraulic gradient trends will continue to be monitored over the duration of the groundwater monitoring program. The calculated horizontal and vertical gradients are shown in Table 2.

3.3 Field Parameter Results

Field parameters consisting of specific conductivity, DO, ORP, pH, and temperature were collected from the monitoring wells sampled during the groundwater sampling event following supplemental amendment injection activities. Specific conductivity values observed during the October 2020 sampling event varied from 366 micro Siemens per centimeter ($\mu\text{S}/\text{cm}$) in PZ-4 to 11,460 $\mu\text{S}/\text{cm}$ in MW-4. Overall, specific conductivity values decreased from March 2020 in MW-5, MW-6, and PZ-4; and increased in MW-4, PZ-1R, and PZ-2R.

DO levels slightly increased in all monitoring wells sampled during the October 2020 groundwater monitoring event following the supplemental amendment injection activities, except at hydraulically cross-gradient well MW-4 (1.45 milligrams per liter [mg/L], October 2020) where DO concentrations have fluctuated between 0.88 mg/L (November 2017) and 8.53 mg/L (March 2020). Overall DO concentrations indicate seasonal variations at the site.

Generally, ORP observations increased in all sampled monitoring wells during the October 2020 sampling event. The only exception was PZ-2R where ORP observations slightly decreased from -68.3 millivolts (mV) in March 2020 to -80.6 mV in October 2020. Negative ORP values were measured in monitoring wells within and hydraulically downgradient of the *in-situ* soil blending area (PZ-1R, PZ-2R, and MW-6). The field parameter measurement results are shown in Table 3.

3.4 Groundwater Laboratory Analytical Results

Groundwater samples were collected from six monitoring wells and submitted for laboratory analysis in accordance with the approved sampling plan. A copy of the October 2020 laboratory analytical report is provided in Appendix B. Estimated concentrations above the detection limit but below the quantification limit were qualified with a "J" in the laboratory report.

3.4.1 Geochemical Analytical Results

Monitoring well PZ-1R was sampled for MNA parameters in October 2020. Table 4 provides a summary of the geochemical analytical results.

Total organic carbon (TOC) concentrations are an indicator of the carbon amendment introduced to the subsurface via the supplemental amendment injection completed in August/September 2020. Concentrations of TOC in source area well PZ-1R increased from 115 mg/L in March 2020 to 2,440 mg/L in October 2020. This increase is indicative of effective carbon substrate distribution following the supplement *in-situ* ERD injections.

Ferrous iron is produced by the reduction of ferric iron and is also produced via corrosion of ZVI which was introduced during the supplemental *in-situ* ERD injections. The concentration of ferrous iron in PZ-1R increased from 5.1 mg/L (March 2020) to 168 mg/L (October 2020). The substantially higher October 2020 ferrous iron concentration value compared with the initial post-soil blending remedial action treatment value of 5.8 mg/L (May 2019) is indicative of strong iron-reducing conditions.

Sulfate is an alternative electron acceptor for microbial respiration in the absence of oxygen (anaerobic conditions). Sulfate concentrations less than 20 mg/L are desirable (but not required) for anaerobic dechlorination to occur. At monitoring well PZ-1R, within the treatment zone, sulfate concentrations drastically decreased from 85.9 mg/L in March 2020 to an estimated concentration of 4.9 mg/L in October 2020 and is indicative of sulfate-reducing conditions.

Elevated methane concentrations indicate that fermentation is occurring in a highly anaerobic environment and reducing conditions are appropriate for anaerobic dechlorination of CVOCs to occur. At treatment zone monitoring well PZ-1R, methane concentrations have increased from 162 micrograms per liter ($\mu\text{g}/\text{L}$) in March 2020 to 1,510 $\mu\text{g}/\text{L}$ in October 2020 and is indicative of methanogenic conditions in a highly anaerobic environment.

Elevated concentrations of ethene and ethane can be used to infer that anaerobic dechlorination of CVOCs is occurring. With respect to groundwater samples obtained from treatment zone well PZ-1R, ethene concentrations increased by an order-of-magnitude from 974 $\mu\text{g}/\text{L}$ in March 2020 to 1,320 $\mu\text{g}/\text{L}$ in October 2020. Ethane concentrations decreased from 2,130 $\mu\text{g}/\text{L}$ in March 2020 to 1,560 $\mu\text{g}/\text{L}$ in October 2020. The detected presence of ethene and ethane in the treatment zone is indicative of *Dhc* microbial development needed for complete reductive dechlorination of CVOCs to non-toxic end products.

3.4.2 VOC Analytical Results

Concentrations of VOCs were detected above laboratory detection limits in all six monitoring wells (MW-4, MW-5, MW-6, PZ-1R, PZ-2R, and PZ-4) sampled in October 2020. Four of the six monitoring wells (MW-4, MW-5, PZ-1R, and PZ-4) had detections of tetrachloroethene (PCE) above the WAC NR 140 ES of 5 $\mu\text{g}/\text{L}$ at concentrations ranging from 21.7 $\mu\text{g}/\text{L}$ (MW-5) to 28,800 $\mu\text{g}/\text{L}$ (PZ-1R). Three monitoring wells (MW-5, MW-6, and PZ-1R) had detections of trichloroethene (TCE) above the WAC NR 140 ES of 5.0 $\mu\text{g}/\text{L}$ at concentrations of 5.2 $\mu\text{g}/\text{L}$, 15.6 $\mu\text{g}/\text{L}$, and 2,280 $\mu\text{g}/\text{L}$, respectively. Groundwater samples from MW-6, PZ-1R, and PZ-2R had detections of cis-1,2,-dichloroethene above the WAC NR 140 ES of 70 $\mu\text{g}/\text{L}$, at concentrations of 172 $\mu\text{g}/\text{L}$ and 6,500 $\mu\text{g}/\text{L}$, 90.2 $\mu\text{g}/\text{L}$, respectively. Cis-1,2,-dichloroethene was detected above the PAL of 7.0 $\mu\text{g}/\text{L}$ but below the ES in MW-5 at a concentration of 11.3 $\mu\text{g}/\text{L}$. Four of the six monitoring wells sampled in October 2020 had detections of vinyl chloride above the WAC NR 140 ES of 0.2 $\mu\text{g}/\text{L}$ at concentrations ranging from 1.5 $\mu\text{g}/\text{L}$ (MW-5) to 822 $\mu\text{g}/\text{L}$ (PZ-1R). No other VOCs were detected above WAC NR 140 criteria.

Concentrations of PCE in PZ-1R is consistent with continued back-diffusion of PCE from the fine-grained silty clay soils within the treatment zone in response to the groundwater remedial action. However, the October 2020 concentrations of degradation compounds trichloroethene, cis-1,2-dichloroethene and vinyl chloride were all lower than their respective previous post-treatment values. A summary of VOC analytical results is provided in Table 5. The detected CVOC analytical results from the groundwater sampling event are shown in Figure 5.

3.4.3 Waste Disposal

Purge water and decontamination fluids from the October 2020 groundwater sampling activities were containerized in 55-gallon drums and transported off site for disposal by Veolia North America on October 30, 2020. Waste disposal documentation is included as Appendix C.

4. CONCLUSIONS AND RECOMMENDATIONS

Supplemental *in-situ* ERD injection activities were completed August/September 2020. Following the supplemental injection activities, the groundwater monitoring program was continued in October 2020. The supplemental injection activities included nine injections of fine grain quartz sand, ZVI, carbon amendment, bioaugmentation microbial culture, and deoxygenated potable

water and the installation of eight injection wells for potential additional injection events to replenish the carbon amendment and, if needed, the microbial culture.

The October 2020 groundwater sample from treatment zone well PZ-1R contained a TOC concentration more than an order-of-magnitude greater than previous post-treatment TOC concentrations. This finding is indicative of effective carbon substrate distribution in response to the supplemental *in-situ* ERD injection event. Fermentation (production of methane) of the carbon substrate has stimulated strongly reducing conditions, as evidenced by the following:

1. Substantially higher ferrous iron concentration (168 mg/L, October 2020) when compared with previous post-treatment values (5.1 mg/L [March 2020] to 6.5 mg/L [August 2019]), which is indicative of strongly iron-reducing conditions.
2. Lowest to date sulfate concentration (4.9 mg/L [October 2020] versus 85.9 mg/L [March 2020]), which is indicative of sulfate-reducing conditions.
3. Highest to date methane concentration (1,510 µg/L [October 2020] versus 162 µg/L [March 2020]), which is indicative of methanogenic conditions in a highly anaerobic environment.
4. Highest to date concentration of reductive dechlorination end product ethene (1,320 µg/L [October 2020] versus 974 ug/L [March 2020]), the production of which may have been enhanced by the application of *Dhc*-containing microbial culture.

The detected concentration of PCE in the October 2020 groundwater sample collected from well PZ-1R is consistent with continued back-diffusion of PCE from the fine-grained silty clay soils within the treatment zone in response to the groundwater remedial action. However, an encouraging finding is that the October 2020 concentrations of degradation compounds TCE, cis-1,2-dichloroethene and vinyl chloride were all lower than their respective previous post-treatment values.

While the full benefit of the additional treatment has not yet been realized, the continued generation of PCE breakdown products (including non-toxic end product ethene) confirm that reductive dechlorination is taking place and is expected to continue based on the results of the geochemical data. While the need for additional amendment injection events is not recommended at this time, the need for additional injections will continue to be reevaluated based on data obtained as part of the ongoing post remediation groundwater monitoring program.

Groundwater samples are proposed to be collected on a semi-annual basis, consistent with the *Post-Remedial Action Documentation Report* (Ramboll, 2020) previously submitted to the WDNR. The next semi-annual groundwater sampling event is tentatively scheduled for April 2021.

D3 = Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference. H3 = Sample was received or analysis requested beyond the recognized method holding time. MO = Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits. M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery. C4 = Sample container did not meet EPA or method requirements												

Notes:

J = Estimated concentration at or above the level of detection and below the level of quantification.

mg/L = milligrams per liter

mV = millivolts

NA = Data was not collected or not able to be collected.

NS = Not sampled.

ORP = Oxidation-reduction potential; measured in the field.

µg/L = micrograms per liter

All sampling results prior to 2017 obtained from a Site Investigation Report prepared by GZA GeoEnvironmental, Inc. dated February 24, 2012.

⁽¹⁾ Well cap either missing or not plugged at time of inspection; potential for water and other constituents to have entered the well.

⁽²⁾ Monitoring well purged dry after first stabilization parameter reading. Well sampled later in day without collecting new stabilization parameters.

⁽³⁾ Monitoring well purged dry before water passed completely through flow-through cell. Stabilization parameters collected from flow-through cell approximately 4/5 of the way full.

⁽⁴⁾ Monitoring well was damaged during site redevelopment activities and was not sampled.

D3 = Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

H3 = Sample was received or analysis requested beyond the recognized method holding time.

MO = Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

C4 = Sample container did not meet EPA or method requirements

Notes:

All results reported in micrograms per Liter (ug/L)

ES = Enforcement Standard

PAL = Preventive Action Limit

Bold value = NR 140 ES Exceedance

Italic Value = NR 140 PAL Exceedance

#N/A = Not analyzed

NS = Not sampled

J = Estimated concentration. Laboratory results reported between the limit of detection and limit of quantification.

¹ Analytical results are displayed for detected parameters only.

² All sampling results prior to 2017 obtained from a Site Investigation Report prepared by GZA GeoEnvironmental, Inc. on February 24, 2012.

³ Standards are for 1,2,4- and 1,3,5-Trimethylbenzene

⁴ Standards are for Total Xylenes (-m, -p, and -o).

⁵ MW-8 not sampled during the November 2017 groundwater sampling event because well did not recharge sufficiently.

⁶ PZ-2 was not sampled during the May 2019 groundwater sampling event because well was damaged during site redevelopment activities.

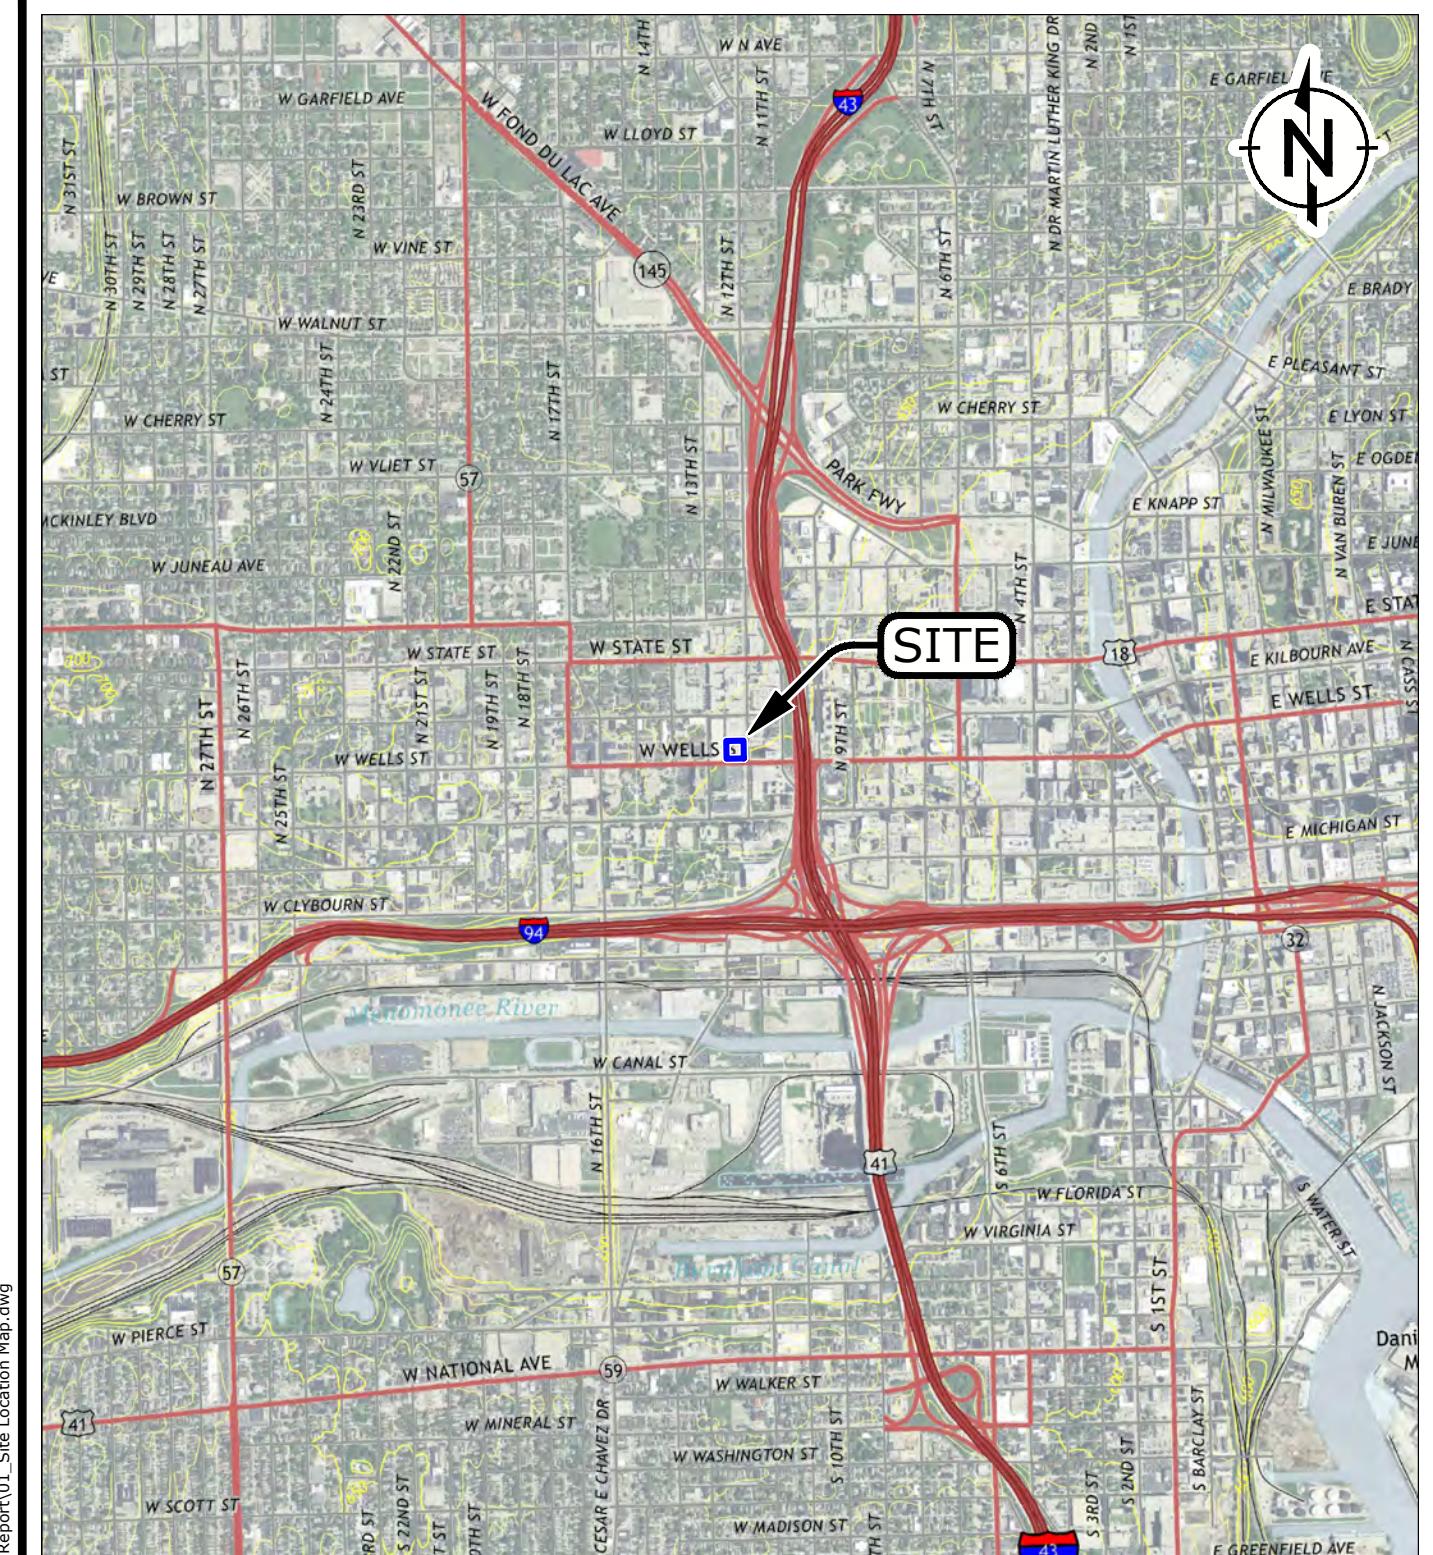

ND = Not detected at or above limit of detection.

M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

C4 = Sample container did not meet EPA or method requirements.

D3 = Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

GROUNDWATER MONITORING PROGRAM LABORATORY ANALYTICAL REPORTS

November 05, 2020

Susan Petrofske
Ramboll Environ
175 North Corporate Drive
Suite 160
Brookfield, WI 53045

RE: Project: 1690005819 FMR 1-HR VALET
Pace Project No.: 40217406

Dear Susan Petrofske:

Enclosed are the analytical results for sample(s) received by the laboratory on October 29, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace National - Mt. Juliet
- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Steven Mleczko

QUALIFIERS

Project: 1690005819 FMR 1-HR VALET
Pace Project No.: 40217406

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor, percent moisture, initial weight and final volume.

LOQ - Limit of Quantitation adjusted for dilution factor, percent moisture, initial weight and final volume.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

C4 Sample container did not meet EPA or method requirements.

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

H3 Sample was received or analysis requested beyond the recognized method holding time.
