RE: Quarterly Progress Report for the Moose Junction Lounge LUST Investigation near Dairyland, WI.
Wisconsin Unique ID# 0301.

Dear Mr. Saari:

Earth Burners Inc. (EBI) presents this Quarterly Progress Report as required by Administrative Order No. NWD-92-023. The following actions were completed in the fourth quarter of 1994:

- * Groundwater sampling on October 27, 1994 and review associated analytics,
- * Prepare an annual report for WDNR review.

Groundwater at the MW-2 location dropped to 120 ppm in the October sampling event. (GRO concentrations were 222 ppm in March, 1994 and decreased to 140 ppm in July, 1994). Groundwater at the MW-3 and the MW-4 locations were below analytical detection limits for concentrations of GRO and PVOC in the October sampling event. Concentrations at the MW-1 location increased to 280 ppb GRO from 140 ppb in the previous sampling. EBI plans to conduct the seventh groundwater sampling event in late January or early February, 1995. The conversion of MW-2 into a recovery well was not completed as previously scheduled because of monetary problems. PECFA review for previously completed work is scheduled for April, 1995. EBI will complete an Annual report which will include groundwater analytical reports for the previous year and estimated costs for various other remedial options concerning contamination at the MW-2 location. If you have any questions concerning any aspect of this progress report, please call me at (218) 628-0454 during business hours.

Sincerely,

Roger W. Biebl
Project Hydrogeologist
