RE: Semi-Annual Groundwater Monitoring Report for the 1st and 2nd Quarters 2015
Former Robinson's Dry Cleaners
1838 West Court Street, Janesville, Wisconsin
BRRTS# 02-54-221852
EnviroForensics Project# 6155

Dear Mr. Warpinski:

Environmental Forensic Investigations, Inc. (EnviroForensics) is pleased to submit this Semi-Annual Groundwater Monitoring Report for the former Robinson's Cleaners located at 1838 West Court Street, Janesville, Wisconsin (Site). The location of the Site is shown on **Figure 1**. This report includes data collected during the 1st and 2nd quarter 2015 groundwater monitoring events. The groundwater monitoring activities were conducted as part of the on-going investigation of the extent and degree of groundwater impacts and evaluation of the plume dynamics.

SITE BACKGROUND

The Site was agricultural land previous to at least 1950. Commercial development of the Site as the Sunnyside Shopping Center and the Sunnyside Gasoline Service Station began sometime between 1950 and 1956. Structural additions to the west side of the shopping center in the early 1960s provided room for additional tenants, eventually including Robinson's Cleaners.

The former Robinson's Cleaners facility was located in the west end of the strip mall in a mixed residential/commercial area of west-central Janesville. A city park is located to the north of the property; single family residences are located to the northwest, northeast and east. Commercial use structures are located to the southeast, south, southwest, and west. The Site map showing the locations of all groundwater monitoring wells is presented on **Figure 2**.

Geology and Hydrogeology

The surface topography is relatively flat in the immediate vicinity of the Site. However, approximately 2,300 feet to the east and south of the Site, topography begins to slope downward towards the Rock River basin from an elevation of approximately 835 feet above mean sea level (AMSL) to approximately between 765 feet AMSL to the east and 750 feet AMSL to the south. The geology in the vicinity of the Site (north and west of the Rock River) has been historically shaped mainly by the erosional effects of pre-glacial streams and rivers, followed by additional glacial erosion and subsequent deposition of unconsolidated glacial and fluvial deposits. The ancestral Rock River valley extends up to 300 feet into the bedrock surface, and is now filled with glacial outwash and other fluvial deposits.

Data collected from soil borings at the Site indicate that there is between 8 to 10 feet of unconsolidated sand, silt, and clay deposits. The upper bedrock consists of the Ordovician-age Platteville-Galena Formation, which is described as limestone and dolomite, dense to porous, and having shale partings. The Platteville Formation is further described as vertically fractured with prominent bedding planes. Dissolution features occur along the fractures and bedding planes, increasing secondary and tertiary porosity in the Formation. Locally, the Formation is known as the Platteville Dolomite and is observed directly under the Site from approximately 10 to 48 feet below ground surface (bgs). The Platteville Dolomite has been eroded away just west of the Site and further to the south of the Site, where unconsolidated soil directly overlies the St. Peter Sandstone. Dolomite was not encountered at locations MW-34D, MW-38D, or PZ-42 (see **Figure 2**).

Underlying the Platteville Dolomite is the Ordovician St. Peter Formation, which is approximately 150 to 200 feet thick. The St. Peter Formation is sandstone comprised of fine to medium-grained, well rounded quartz sand with frosted surfaces. In some places the formation is greater than 99.5% quartz grains. The St. Peter Formation has silica cement and is loosely cemented in some places making it more easily erodible than the overlying dolomite formation. Locally, the Formation is known as the St. Peter Sandstone and is first encountered at a depth of 40 feet bgs at the Site; however, it is eroded away partially or completely by glacial action and the pre-glacial Rock River. The St. Peter Sandstone has been eroded away at some point between well clusters PZ-44 and PZ-47; and PZ-42 and PZ-46. At well clusters PZ-46 and PZ-47, the St. Peter Sandstone is absent. Dolomite of the Prairie du Chien Group was encountered at a depth of approximately 180 feet bgs at PZ-47, and at a depth of 221 feet bgs at PZ-46 (see **Figure 2**).

The unconsolidated deposits overlying the Platteville Dolomite at the Site are very thin, and groundwater is not typically encountered within these deposits. Groundwater elevation measurements in monitoring wells completed in both the Platteville Dolomite and the St. Peter Sandstone indicate two (2) separate water bearing units. Dolomite formations are typically massive and have very minimal primary porosity. Groundwater can only flow through this material where it has been fractured or weathered creating a higher secondary porosity.

Groundwater elevations in the Platteville dolomite near the Site suggest that groundwater flows toward the southwest into the valley fill, and then into the hydraulically connected St. Peter Sandstone. Groundwater within the dolomite can also leak directly into the St. Peter Sandstone at locations where vertical fractures completely penetrate the dolomite.

Groundwater within the St. Peter Sandstone, and in the unconsolidated deposits where the dolomite and sandstone bedrock has been eroded away, is unconfined and represents a deeper water table. The depth to groundwater in the sandstone varies within the current monitoring well network at approximately 43 to 56 feet bgs. Groundwater within the sandstone has been measured flowing towards the Rock River to the southeast.

GROUNDWATER MONITORING ACTIVITIES

Groundwater monitoring activities included groundwater elevation measurements and sample collection. EnviroForensics personnel conducted the 1st and 2nd Quarter 2015 monitoring events during March 23-26 and June 1-9, respectively.

Groundwater Elevation Measurements

During the first quarter 2015 monitoring event, groundwater elevation measurements were collected from new monitoring wells only (i.e., those wells installed between December 2014 and March 2015). During the second quarter 2015 monitoring event, groundwater elevation measurements were collected from all accessible wells at the Site, with the exception of those wells slated for abandonment and replacement (see **Table 1**). Depth to water was measured to the nearest 0.01 foot using an electronic water level indicator. The well caps were removed at least 15 minutes prior to measurement to allow equilibration with atmospheric pressure. The depth-to-water measurements were recorded in the project field book and on field sampling forms (**Attachment 1**).

Groundwater Sampling

Samples were collected and analyzed from selected monitoring wells at the Site to monitor the nature and extent of dissolved phase contaminant concentrations. The list of wells from which samples were collected during the two (2) monitoring events is presented in **Table 1**.

Monitoring well sampling was completed following low-flow (minimal drawdown) groundwater sampling procedures. The procedure involves low volume groundwater purging rates while maintaining minimal drawdowns, typically less than 0.1 meters. EnviroForensics employed a submersible pump to evacuate water from the screened portion of the well to a surface flow-through cell apparatus with multi-parameter water quality probe. The probe measures groundwater geochemical parameters such as pH, oxidation-reduction potential (ORP), specific conductivity, temperature, turbidity, and dissolved oxygen. Water quality parameters were monitored during purging to verify stabilization prior to groundwater sample collection.

Equipment was calibrated prior to use. Data collected during the sampling activities were documented on field sampling forms provided in **Attachment 1**.

After the geochemical parameter readings stabilized, groundwater samples were collected by discharging directly into laboratory provided containers. Sample containers were placed into a cooler containing ice pending transport to a laboratory for analysis. Proper chain-of-custody documentation was maintained at all times. Groundwater samples were analyzed for volatile organic compounds (VOCs) according to EPA Method SW-846 8260.

Quality assurance/quality control (QA/QC) samples were collected in accordance with WAC Chapter NR 716, including one (1) duplicate sample and one (1) equipment blank sample for every ten (10) samples, and one (1) trip blank sample per cooler. Investigation-derived media (IDM), consisting of purge and decontamination fluids, were stored on-site in sealed and labeled 55-gallon steel drums.

Samples were also collected in passive diffusion bags (PDBs) from eight (8) monitoring wells in order to evaluate the efficacy of using PDBs for Site-wide groundwater sampling. PDBs were deployed in MW-3, MW-6, MW-13, MW-13D, MW-26, MW-30S, MW-30D, and MW-37D on May 19, 2015 and retrieved on June 1, 2015. The water in the PDBs was transferred directly into laboratory provided containers and submitted to a laboratory for VOC analysis.

RESULTS

Groundwater Elevation and Flow Direction

Groundwater elevation data associated with the 1st and 2nd quarter 2015 monitoring events are summarized in **Table 2**. Potentiometric surface contour maps for the Platteville dolomite and St. Peter Sandstone/unconsolidated during May 2015 are presented on **Figures 3a and 3b**, respectively. In general, groundwater elevations decreased compared to December 2014, which is likely indicative of the dryer than average winter. Furthermore, the potentiometric surface in the St. Peter Sandstone has decreased consistently over the past six (6) quarters of monitoring instead of fluctuating seasonally.

Groundwater is first encountered under the Site in the dolomite at a depth of approximately 17 to 19 feet bgs (monitoring well MW-20S). The potentiometric surface elevation drops by more than 23 feet from the Site to the most down-gradient dolomite well (MW-31S), a distance of approximately 450 feet, indicating a hydraulic gradient of 0.05 feet per foot. Groundwater in the dolomite flows toward the southwest and into the unconsolidated valley fill deposits.

The depth to groundwater in the sandstone/unconsolidated deposits varies within the current monitoring well network between approximately 23 feet bgs (PZ-47) and 62 feet bgs (MW-44S). The large difference in depth to groundwater is due, in part, to a decrease in surface topography from 825.04 feet AMSL at MW-44S to 784.38 feet AMSL at PZ-47. The potentiometric surface

elevation in the sandstone/unconsolidated deposits drops by approximately 19 feet within the monitored area, with a hydraulic gradient of approximately 0.005 feet per foot. The direction of groundwater flow in the sandstone/unconsolidated deposits is southeast towards the Rock River.

Low-Flow Groundwater Sample Analytical Results

Groundwater sample analytical results are summarized in **Table 3**. The complete laboratory reports are provided in **Attachment 2**. VOC concentrations are compared to public health standards listed in Wisconsin Administrative Code (WAC) Chapter NR 140. Tetrachloroethene (PCE) isoconcentration maps for groundwater in the Platteville Dolomite and the St. Peter Sandstone\unconsolidated sediment units are presented on **Figures 4a** and **4b**.

Groundwater impacts are present in both units. Compounds that were detected at concentrations exceeding Wisconsin Administrative Code NR 140 Enforcement Standards (ESs) in one or more samples were PCE, trichloroethene (TCE), vinyl chloride, and unrelated petroleum compounds. Additionally, cis-1,2-dichloroethene (cis-1,2-DCE) was detected in several samples at concentrations above the preventive action limit (PAL).

PCE was the most commonly detected compound. PCE was detected in samples collected from 27 monitoring wells at concentrations exceeding the Enforcement Standard (ES). The highest concentrations of PCE were observed at MW-39S, a new well screened in the dolomite near the Site building; and sandstone wells MW-13 and MW-25D which are located southwest (down-gradient) of the Site. PCE was reported at 2,440 micrograms per liter (µg/L) at MW-39S during the 2nd quarter monitoring event. The PCE concentration in St. Peter Sandstone wells MW-13 and MW-25D was 600 µg/L during the 2nd quarter monitoring event.

TCE was detected at concentrations exceeding the ES (5 µg/L) in 12 monitoring wells, including MW-39S, the recently installed dolomite well near the source area, and down-gradient wells screened in the St. Peter Sandstone (MW-25D and MW-37D).

Petroleum compounds, unrelated to former Robinson's operations at the Site, were detected at monitoring well MW-17; however, the concentrations of all petroleum compounds were less than ESs. These compounds (benzene, ethylbenzene, naphthalene, trimethylbenzene, and xylenes) were historically detected in samples collected from MW-17, MW-17S and MW-18.

Duplicate and field blank results associated with this monitoring event confirmed sample integrity and analytical data quality.

Passive Diffusion Bag Sample Analytical Results

The analytical results of the PDB samples are included in **Table 3**, and a comparison of the PDB and low-flow sample results is provided in **Table 4**. The low-flow samples were collected between two (2) and seven (7) days after the PDB samples were collected. However, a low-flow

sample could not be collected from MW-6 due to an insufficient volume of groundwater in the well.

No patterns or trends are evident when comparing the two data sets. Four (4) of the PDB samples had concentrations less than their associated low-flow sample, and three (3) of the PDB samples contained higher concentrations. In general, the analytical results of PDB and low-flow samples were more comparable in wells having lower CVOC impacts than in wells having higher impacts (i.e., at MW-3 and MW-26) The variability in results between the two sample collection methods may indicate that changes in contaminant concentrations can occur rapidly within the groundwater system (within a day, or so).

Historical data provided in **Table 3** show that VOC concentrations are highly variable at many wells. In all cases, the PDB sample results were within the historical range of concentrations detected at each well. Another set of comparison samples should be collected to confirm the suitability of the PDB sampling method at the Site. The low-flow samples should be collected immediately following removal of the PDB samplers at each well due to the potential for large changes in contaminant concentration over a short time frame.

Fate and Transport

Residual soil impacts are present beneath the former drycleaner and adjacent business spaces as well as an area behind (north of) the former dry cleaner. It appears that vertical migration of PCE has occurred through the unsaturated portion of the Platteville Dolomite resulting in the currently observed distribution of dissolved phase impacts in both bedrock formations and in the unconsolidated sediment where bedrock has been eroded. VOCs have not been detected in samples collected from up-gradient monitoring wells, indicating there are no up-gradient contributions to the groundwater plume.

Contaminants released at the Site appear to have entered the Platteville Dolomite and migrated into the St. Peter Sandstone. In some places vertical fractures may completely penetrate the dolomite resulting in a direct migration pathway to the underlying St. Peter Sandstone. Contaminated groundwater in the dolomite migrates to the southwest in the direction of groundwater flow, potentially along horizontal bedding planes and other horizontally oriented fracture zones. Along this flow path where the fractures penetrate through the entire thickness of the dolomite, impacts can leak through into the underlying sandstone. Contaminated groundwater may also migrate within the dolomite to reach the valley fill located to the west. Here the dolomite has been eroded away and the water table resides within the St. Peter Sandstone. Water was observed during a downhole camera investigation on top of the dolomite flowing on the surface, which dips southwest (similar to groundwater flow in the dolomite) and enters the valley fill and sandstone aquifer. This transport mechanism is consistent with high concentrations of PCE in the sandstone southwest of the site.

As shown on **Figures 4a** and **4b**, the PCE plume extends a considerable lateral distance from the source area. The downgradient extent of impacts in concentrations above the groundwater ES has been defined in the sandstone/unconsolidated sediment by well nests PZ-44, PZ-46, and PZ-47 as shown on **Figure 4b**. Vertical migration has also occurred as evidenced by concentrations in down-gradient well nests. The middle or deepest monitored zone exhibits the highest PCE concentrations at the PZ-25 and PZ-42 well nests. The vertical expression is most likely attributable to the downward vertical gradient observed in the existing well nests.

Graphs depicting PCE concentration and groundwater elevation over time are presented in **Attachment 3**. The fluctuations in contaminant concentrations over time observed at several monitoring wells are expected due to storage of contaminant mass in the dolomite and overlying unconsolidated sediment at the Site. The release and movement of mass within the groundwater systems likely varies according to groundwater elevation and recharge conditions.

RECOMMENDATIONS

Due to the expansion of the monitoring well network and historical data set available, EnviroForensics is planning the following activities during the remainder of 2015:

- Abandon MW-26S due to dry conditions in the unconsolidated sediment; and

- Abandon MW-32S, MW-33S, and MW-34S which have been dry for most of the sampling events (but have shown previous VOC detections), and replace with deeper monitoring wells screened within the unconsolidated sediment.

Additionally, EnviroForensics recommends continued quarterly groundwater monitoring as outlined on **Table 1**. The PDB sample comparison conducted during the 2nd quarter monitoring event should be repeated using the same monitoring wells during the 4th quarter monitoring event to better determine the applicability of the PDB method for long term monitoring. Low-flow sampling methods should be utilized at these locations immediately following the removal of the PDB samplers. Due to a low amount of water in well MW-6, a PDB sampler should not be deployed at this location.

We appreciate the opportunity to provide you with this information. If you have any questions or require additional information, please don't hesitate to contact us at 262-290-4001.

Sincerely,
Environmental Forensic Investigations, Inc.

Notes:
All concentrations reported in units of µg/L = micrograms per liter
Samples analyzed using EPA SW-846 Method 8260
VOCs = Volatile Organic Compounds
The former Robinson's Cleaners is not responsible for the presence of compounds unrelated to tetrachloroethene or its degradation products.
Bolded values are above detection limits
Bolded and Shaded values are above the Public Health Enforcement Standard
Bolded and Shaded values are above Public Health Preventive Action Limit
B = Analyte was deducted in the associated Method Blank
E = Compound response exceeded the response of the highest standard in the initial calibration range of the instrument
J = Analyte concentration detected between the laboratory Reporting Limit and the laboratory Method Detection Limit
Q = Results reported between the Method Detection Limit (MDL) and the Limit of Quantitation are less certain than results at or above the LOQ.
NA = Not analyzed
NLRA = No laboratory results available
NES = No Environmental Standard
* = Well samples collected on these dates were inadvertently switched in the field based on past data and are correctly displayed in this table.
** = p-Isopropyltoluene and/or di-isopropyl ether detected in this sample at concentrations below public health criteria

Notes:

All concentrations reported in units of ug/L = micrograms per liter

Samples analyzed using EPA SW-846 Method 8260

The former Robinson's Cleaners is not responsible for compounds unrelated to tetrachloroethene or its degradation products.

Bolded values are above detection limits

Bolded and Shaded values are above the Public Health Enforcement Standard

Bolded and Shaded values are above Public Health Preventive Action Limit

J = Estimated concentration between the laboratory Method Detection Limit and Reporting Limit

PDB = Passive Diffusion Bag

GROUNDWATER SAMPLING FORM

602 N. Capital Ave
Indianapolis, IN 46204
T: 317-972-7870 F: 317-972-7875

PROJECT NAME: Former Robinson's Cleaners
Well/Surface Station I.D.: 6155 - PZ - 25D2
LOCATION/ADDRESS: 1838 W. Court Street, Janesville, WI 53548
Sample Designation: PZ - 25D2
PROJECT NO.: 6155.41A
CLIENT/CONTACT: Ray Gehrig / 608-436-6277
Personnel: K. Vander Heiden, A. Jablonski

WATER LEVEL MEASUREMENTS DURING GAUGING:

Well Depth: 152.31'
Depth to Water: 56.42'
Well Diameter: 2 inches
Casing Volume: ____ gallons
Volume Removed: ____ gallons
Total No. of Casing Volumes Removed: ____
Date: 3/23/2015

Factor * Water Column Height Equals Gallons	
Factor	Diameter
0.163	2" Well
0.653	4" Well
1.469	6" Well
Conversions	
1 mL =	0.0003 gal
1 gal =	3,785 mL

SAMPLING METHOD:

Low-Flow: X
Grab/No-purge:
Bailer:
Peristaltic pump:
Submersible Pump: X
Passive Diffusion Bag[2]:
Other:
Was drawdown greater than 0.3 ft? (y/n):
Pump Depth (ft below TOC) (if applicable): 149.81

Stability Parameter Readings: Readings every five minutes for at least three readings to achieve stability for ALL parameters except as noted.

Start Time: 1427	Temperature (Celsius) +/- 3%	pH +/- 0.1	Oxidation-Reduction Potential (mV) +/- 10mV*	Specific Conductance (umhos/cm) +/- 3%	Turbidity (NTU) +/- 10%*	Dissolved Oxgen (mg/L) +/- 10%*	Sampling DTW (ft) <0.3ft	Flow Rate (ml/min) <250	mL Removed
1432	9.52	7.74	296	0.952	385	8.71	51.44	125	625
1437	9.13	7.64	300	0.948	180	8	51.24	80	1025
1442	8.94	7.56	304	0.941	119	7.84	51.02	80	1425
1447	8.69	7.5	307	0.98	81.9	6.48	50.06	80	1825
1452	8.6	7.52	309	0.941	87.6	7.98	50	80	2225

* Only one (1) of these need to reach stability.

PURGE[1]: Date: ____ Time: ____
SAMPLING: Date: 3/24/2015 Time: 1458

Sample Analysis	Volume	Type	Number of Containers	Preservative Type	Reaction (y/n)	Filter Type	Duplicate	MS/MSD
VOC-8260	40mL	VOA	3	HCL	N	None	na	--

EQUIPMENT DECONTAMINATION PROCEDURES:

DECONTAMINATION METHOD:
- ☒ Non Phosphatic detergent wash/distilled water rinse
- ☐ Methanol rinse

NOTES: 2 bladders and 192.81' tubing used

Sampler Signature:

[1]Monitoring wells sampled with a bailer require at least 3 to 5 well volumes to be purged prior to sampling unless the well bails dry prior to the removal of three (3) well volumes. Wells bailed dry should be sampled upon sufficient recovery for collection of samples. Record the time of purging and the time of sampling on the Groundwater Sampling Form.

[2]Include Date PDB Installed in well, and Date PDB removed and sampled in NOTES section.

Sample Designation: PZ - 46D2
PROJECT NO.: 6155.41A
CLIENT/CONTACT: Ray Gehrig / 608-436-6277
Personnel: K. Vander Heiden, A. Jablonski

WATER LEVEL MEASUREMENTS DURING GAUGING:

Well Depth: 222.78
Depth to Water: 58.89
Well Diameter: 2"
Casing Vclume: _____ gallons
Volume Removed: _____ gallons
Total No. of Casing Volumes Removed: _____
Date: 3/23/2015

Factor * Water Column Height Equals Gallons	
Factor	Diameter
0.163	2" Well
0.653	4" Well
1.469	6" Well
Conversions	
1 mL =	0.0003 gal
1 gal =	3,785 mL

SAMPLING METHOD:

Low-Flow	X
Grab/No-purge	
Bailer	
Peristaltic pump	
Submersible Pump	X
Passive Diffusion Bag[2]	
Other	
Was drawdown greater than 0.3 ft? (y/n)	
Pump Depth (ft below TOC) (if applicable)	178.78

Stability Parameter Readings: Readings every five minutes for at least three readings to achieve stability for ALL parameters except as noted.

Start Time: 1414	Temperature (Celsius) +/- 3%	pH +/- 0.1	Oxidation-Reduction Potential (mV) +/- 10mV*	Specific Conductance (umhos/cm) +/- 3%	Turbidity (NTU) +/- 10%*	Dissolved Oxgen (mg/L) +/- 10%*	Sampling DTW (ft) <0.3ft	Flow Rate (ml/min) <250	mL Removed
1419	7.57	7.86	361	0.819	88.3	12.07	58.85	55	275
1424	7.5	7.84	364	0.818	88	8.19	58.85	55	550
1429	7.32	7.82	366	0.82	92	6.49	58.86	55	825
1434	7.15	7.76	370	0.823	57.4	6.45	58.87	55	1100
1439	7.04	7.73	372	0.823	59.3	5.95	58.88	55	1375
1444	6.99	7.69	374	0.822	35	6.12	58.88	55	1650

* Only one (1) of these need to reach stability.

LOCATION/ADDRESS: 1838 W Court Street, Janesville, WI 53548
Sample Designation: MW-9
PROJECT NO.: 6155
CLIENT/CONTACT: Ray Gehrig
Personnel: K. Heimstead, A Jablonski, K. Vander Heiden

WATER LEVEL MEASUREMENTS DURING GAUGING:

Well Depth: 59.07 feet
Depth to Water: 56.03 feet
Well Diameter: ____ inches
Casing Volume: ____ gallons
Volume Removed: ____ gallons
Total No. of Casing Volumes Removed: ____
Date: 5/20/15

Factor * Water Column Height Equals Gallons	
Factor	Diameter
0.163	2" Well
0.653	4" Well
1.469	6" Well
Conversions	
1 mL =	0.0003 gal
1 gal =	3,785 mL

SAMPLING METHOD:

Low-Flow: X
Grab/No-purge: ____
Bailer: ____
Peristaltic pump: ____
Submersible Pump: X
Passive Diffusion Bag[2]: ____
Other: ____
Was drawdown greater than 0.3 ft? (y/n): ____
Pump Depth (ft below TOC) (if applicable): ____

Stability Parameter Readings: Readings every five minutes for at least three readings to achieve stability for ALL parameters except as noted.

Start Time 810	Temperature (Celsius) +/- 3%	pH +/- 0.1	Oxidation-Reduction Potential (mV) +/- 10mV*	Specific Conductance (umhos/cm) +/- 3%	Turbidity (NTU) +/- 10%*	Dissolved Oxgen (mg/L) +/- 10%*	Sampling DTW (ft) <0.3ft	Flow Rate (ml/min) <250	mL Removed
							~~56.40~~	~200	
815	14.34	7.35	286	1.57	774	3.52			1000
820	14.58	6.90	199	1.98	464	4.65			2000
825	14.43	6.95	173	2.43	341	5.90			3000
830	14.48	6.97	160	2.59	318	6.02			4000
835	14.52	6.97	149	2.65	294	6.94			5000
840	14.65	6.96	144	2.67	274	7.67			6000

* Only one (1) of these need to reach stability.

PURGE[1]: Date 6-3-15 Time ____
SAMPLING: Date 6-3-15 Time 845

Sample Analysis	Volume	Type	Number of Containers	Preservative Type	Reaction (y/n)	Filter Type	Dunlicate	MS/MSD
VOC 8260	40mL	VOA	3	HCL	N	NA		NA

EQUIPMENT DECONTAMINATION PROCEDURES:

DECONTAMINATION METHOD:
- [x] Non Phosphatic detergent wash/distilled water rinse
- [ ] Methanol rinse

NOTES:

Sampler Signature: [signature]

[1]Monitoring wells sampled with a bailer require at least 3 to 5 well volumes to be purged prior to sampling unless the well bails dry prior to the removal of three (3) well volumes. Wells bailed dry should be sampled upon sufficient recovery for collection of samples. Record the time of purging and the time of sampling on the Groundwater Sampling Form.

[2]Include Date PDB Installed in well, and Date PDB removed and sampled in NOTES section.

PROJECT NAME: Former Robinson's Cleaners
Well/Surface Station I.D.: 6155- PZ-47D
LOCATION/ADDRESS: 1838 W Court Street, Janesville, WI 53548
Sample Designation: PZ-47D
PROJECT NO.: 6155
CLIENT/CONTACT: Ray Gehrig
Personnel: K. Heimstead, A Jablonski, K. Vander Heiden

WATER LEVEL MEASUREMENTS DURING GAUGING:

Well Depth: 28.73 feet
Depth to Water: 23.43 feet
Well Diameter: _____ inches
Casing Volume: _____ gallons
Volume Removed: _____ gallons
Total No. of Casing Volumes Removed: _____
Date: 5/28/15

Factor * Water Column Height Equals Gallons	
Factor	Diameter
0.163	2" Well
0.653	4" Well
1.469	6" Well
Conversions	
1 mL =	0.0003 gal
1 gal =	3,785 mL

SAMPLING METHOD:

Low-Flow: X
Grab/No-purge: _____
Bailer: _____
Peristaltic pump: _____
Submersible Pump: X
Passive Diffusion Bag[2]: _____
Other: _____
Was drawdown greater than 0.3 ft? (y/n): _____
Pump Depth (ft below TOC) (if applicable): _____

Stability Parameter Readings: Readings every five minutes for at least three readings to achieve stability for ALL parameters except as noted.

Start Time 1115	Temperature (Celsius) +/- 3%	pH +/- 0.1	Oxidation-Reduction Potential (mV) +/- 10mV*	Specific Conductance (umhos/cm) +/- 3%	Turbidity (NTU) +/- 10%*	Dissolved Oxgen (mg/L) +/- 10%*	Sampling DTW (ft) <0.3ft	Flow Rate (ml/min) <250	mL Removed
1120	12.07	7.24	176	0.661	0.00	4.31	23.77	~100	500
1125	19.45	7.22	224	0.671	1.00	3.31	↓	↓	1000
1130	19.65	7.25	225	0.668	727	3.41			1500
1135	18.14	7.21	229	0.683	435	3.53			2000
1140	18.26	7.19	233	0.685	252	3.58			2500
1145	19.75	7.22	232	0.667	221	3.26			3000
~~1150~~ 1200	19.73	7.21	232	0.665	219	3.21			~~3500~~ 3500

* Only one (1) of these need to reach stability.

PURGE[1]: Date 6-5-15 Time _____
SAMPLING: Date 6-5-15 Time ~~1145~~ 1150

Sample Analysis	Volume	Type	Number of Containers	Preservative Type	Reaction (y/n)	Filter Type	Duplicate	MS/MSD
VOC 8260	40mL	VOA	3	HCL	N	NA	—	NA

EQUIPMENT DECONTAMINATION PROCEDURES:

DECONTAMINATION METHOD:
- ■ Non Phosphatic detergent wash/distilled water rinse
- ☐ Methanol rinse

NOTES:

Sampler Signature: _____

[1]Monitoring wells sampled with a bailer require at least 3 to 5 well volumes to be purged prior to sampling unless the well bails dry prior to the removal of three (3) well volumes. Wells bailed dry should be sampled upon sufficient recovery for collection of samples. Record the time of purging and the time of sampling on the Groundwater Sampling Form.

[2]Include Date PDB Installed in well, and Date PDB removed and sampled in NOTES section.

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.
6	The surrogate recovery not within established limits.
8	Closing calibration standard not within established limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.
4	The continuing calibration standard not within established limits.
8	Closing calibration standard not within established limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.
3	The matrix spike not within established limits.
4	The continuing calibration standard not within established limits.
6	The surrogate recovery not within established limits.
8	Closing calibration standard not within established limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.
3	The matrix spike not within established limits.
4	The continuing calibration standard not within established limits.

CWT denotes sub contract lab - Certification #445126660

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.

Comments/Special Instructions (*Specify groundwater "GW", Drinking Water "DW", Waste Water "WW", Soil "S", Air "A", Oil, Sludge etc.)

All samples for VOC analysis were not filtered.

Sample Integrity - To be completed by receiving lab.
Method of Shipment:
Temp. of Temp. Blank ____ °C On Ice: x
Cooler seal intact upon receipt: x Yes ____ No

Relinquished By: (sign)	Time	Date	Received By: (sign)	Time	Date
	2:00	6/10/15		2:00	6/10/15

Received in Laboratory By: Time: 8:00 Date: 6/11/15
