Bill,

I talked over your points with our vapor experts and that discussion concluded with the same recommendations that I previously shared with you. For a complete vapor investigation at the apartment building DNR recommends installing sub-slab vapor ports closer to the center of the building (1-2 ports / 1,500 sq ft), perform another sub-slab vapor sampling event paired with a long duration indoor air sampling event. We are getting close to the end of heating season so this may have to wait until next fall/winter. One other thing to note. Make sure to record temperatures, wind speed & direction, and precipitation during the sampling period; that information will help in DNR's evaluation on whether the vapor investigation is complete in this building.

I read through Table 5b in RR 800 and discussed it to make sure I understood. Typically you would start with the actions detailed in item 1, which talks about concurrent sub-slab and indoor air sampling, before moving on to actions detailed in item 2 of that table.

Reach out with any questions. Let me know if you would like to discuss further; we could have a short meeting with our vapor experts if you'd like. Thank you,

**We are committed to service excellence.**

Visit our survey at <http://dnr.wi.gov/customersurvey> to evaluate how I did.
