KPRG Project No. 15807.4

Dear Mr. Amungwafor:

On September 23, 2010, the Wisconsin Department of Natural Resources (WDNR) issued an Underground Injection Control Approval – Temporary Exemption for the above referenced site. Under the exemption, KPRG proceeded to inject sodium permanganate into the defined source zone of tetrachloroethene (PCE) impacts. Only one round of injection was performed. All aspects of the permit were properly adhered to. Since the initial injection which occurred October, 2010, three rounds of groundwater monitoring have been performed. Figure 1 shows the locations of the initial injection points and all groundwater monitoring data to date is summarized in Table 1.

A review of the data in Table 1 indicates that groundwater within the source area, which is monitored by well MW-9, showed an initial substantial decrease but then groundwater concentrations of PCE and associated breakdown products of trichloroethene (TCE), cis-1,2-dichloroethene (DCE) and vinyl chloride (VC) rebounded and stabilized at concentrations one order of magnitude lower than prior to the injection work. Some rebound was also noted in downgradient monitoring well MW-2 and downgradient well MW-6 indicated all non-detects with no rebound effects as of the last round of sampling. Further downgradient wells have not yet shown decreases in impacts as the treated water may not yet have migrated to those locations. Overall the injection of sodium permanganate has worked well to reduce the source zone PCE impacts beneath the building and immediately adjacent to the back of the building.

Considering the current reduction in source zone PCE concentration and the documented natural reductive dechlorination which is occurring as evidenced by the presence of

breakdown products of TCE, DCE and VC, KPRG proposes to perform a follow-up “polishing” injection to further decrease groundwater impacts. However, rather than performing a second round of chemical oxidation, KPRG proposes to inject a biostimulant to enhance the naturally occurring reductive dechlorination. Therefore, this document is being submitted to request an extension and modification of the existing temporary exemption as discussed below.

Extension Request

A one year extension is being requested.

Modification Request

Rather than injection a chemical oxidant as done initially per the permit, KPRG is proposing to inject a biodegradation enhancement solution into groundwater as a polishing step for site remediation. KPRG proposes to use the Anaerobic BioChem Plus (ABC+) chemistry. The product is marketed by Redox Tech, LLC and is patented by Environmental Technologies, Inc (an Adventous Company). ABC+ is a mixture of ABC® formula and Zero Valent Iron (ZVI). Formulated and mixed on a site-by-site basis, up to fifty percent (50%) by weight of ZVI can be added. ZVI has been proven and widely accepted as an effective in situ remediation technology of chlorinated solvents such as TCA, PCE, TCE, and daughter products. The degradation process using ZVI is an abiotic reductive dechlorination process occurring on the surface of the granular iron, with the iron acting as an electron donor.

The addition of ZVI to the ABC® mixture provides a number of advantages for enhanced reductive dechlorination (ERD). The ZVI will provide an immediate reduction. The ABC® will provide short-term and long-term nutrients to anaerobic growth, which also assists to create a reducing environment. ABC® contains soluble lactic acid and a phosphate buffer that provides phosphates, which are a micronutrient for bioremediation, and maintains the pH in a range that is best suited for microbial growth. In addition, the corrosion of iron metal yields ferrous iron and hydrogen, both of which are possible reducing agents.

The ABC® and ZVI are mixed with potable water and emplaced in the subsurface simultaneously. The dilution factor (i.e. water content) can be adjusted to achieve optimal dispersion and distribution based on site-specific parameters such as well spacing, permeability of the formation, and contaminant concentrations. The solution can be emplaced by a variety of techniques, including injection through wells or drill rods (for permeable geologic environments such as sands and fractured rock), hydraulic fracturing (for lower permeable environments such as silt and clay), and through soil blending (for all unconsolidated shallow depth applications less than 20 ft bgs).

The proposed chemistry injection will occur at 26 injection points as shown on Figure 2. A total of 140 gallons of 12% ABC+ will be injected into each point. In accordance with

the current permit requirements, explosive limit monitoring will be performed in adjoining monitoring locations. Liquid extraction will be concurrently performed in the extraction wells previously installed at the site as part of the initial injection. The extraction from these wells during injection assists in distributing the chemistry through the aquifer matrix. The extraction of water will be performed using a Vac-truck. Extracted water will be temporarily stored in a portable above ground tank. At the completion of the injection work, the water will be sampled and profiled for proper off-site disposal.

Additional Verification Groundwater Monitoring (4 Quarters Post-Injection)

Within three weeks of the completion of initial injection, a quarterly groundwater monitoring program will be initiated for all existing monitoring wells (i.e., well MW-1 through MW-12, PZ-1 and PZ-2) and the new well MW-13 which was recently installed. One duplicate sample will be collected per round of monitoring for quality assurance purposes. The samples will be collected using the standard bail and purge method. Purge water will be collected in a 55-gallon drum for subsequent proper off-site disposal. Samples collected will be analyzed for VOCs. Field measurements of water level, pH, temperature, specific conductivity and oxidation-reduction potential (ORP) will be recorded. At this time a total of four quarters of sampling are proposed. The results of the monitoring will determine the effectiveness of the injection relative to contaminant concentration reduction and impacted groundwater plume stability. All well locations are shown on Figure 3.

WPDES Program Notification

The information provided in this submittal was also forwarded to Ms. Christine Lilek, Senior Wastewater Specialist with the WDNR WPDES program via e-mail.

KPRG and K&W Manufacturing appreciate your consideration of this matter. If there are any questions or if any additional supporting information is needed, please contact me at 262-781-0475.

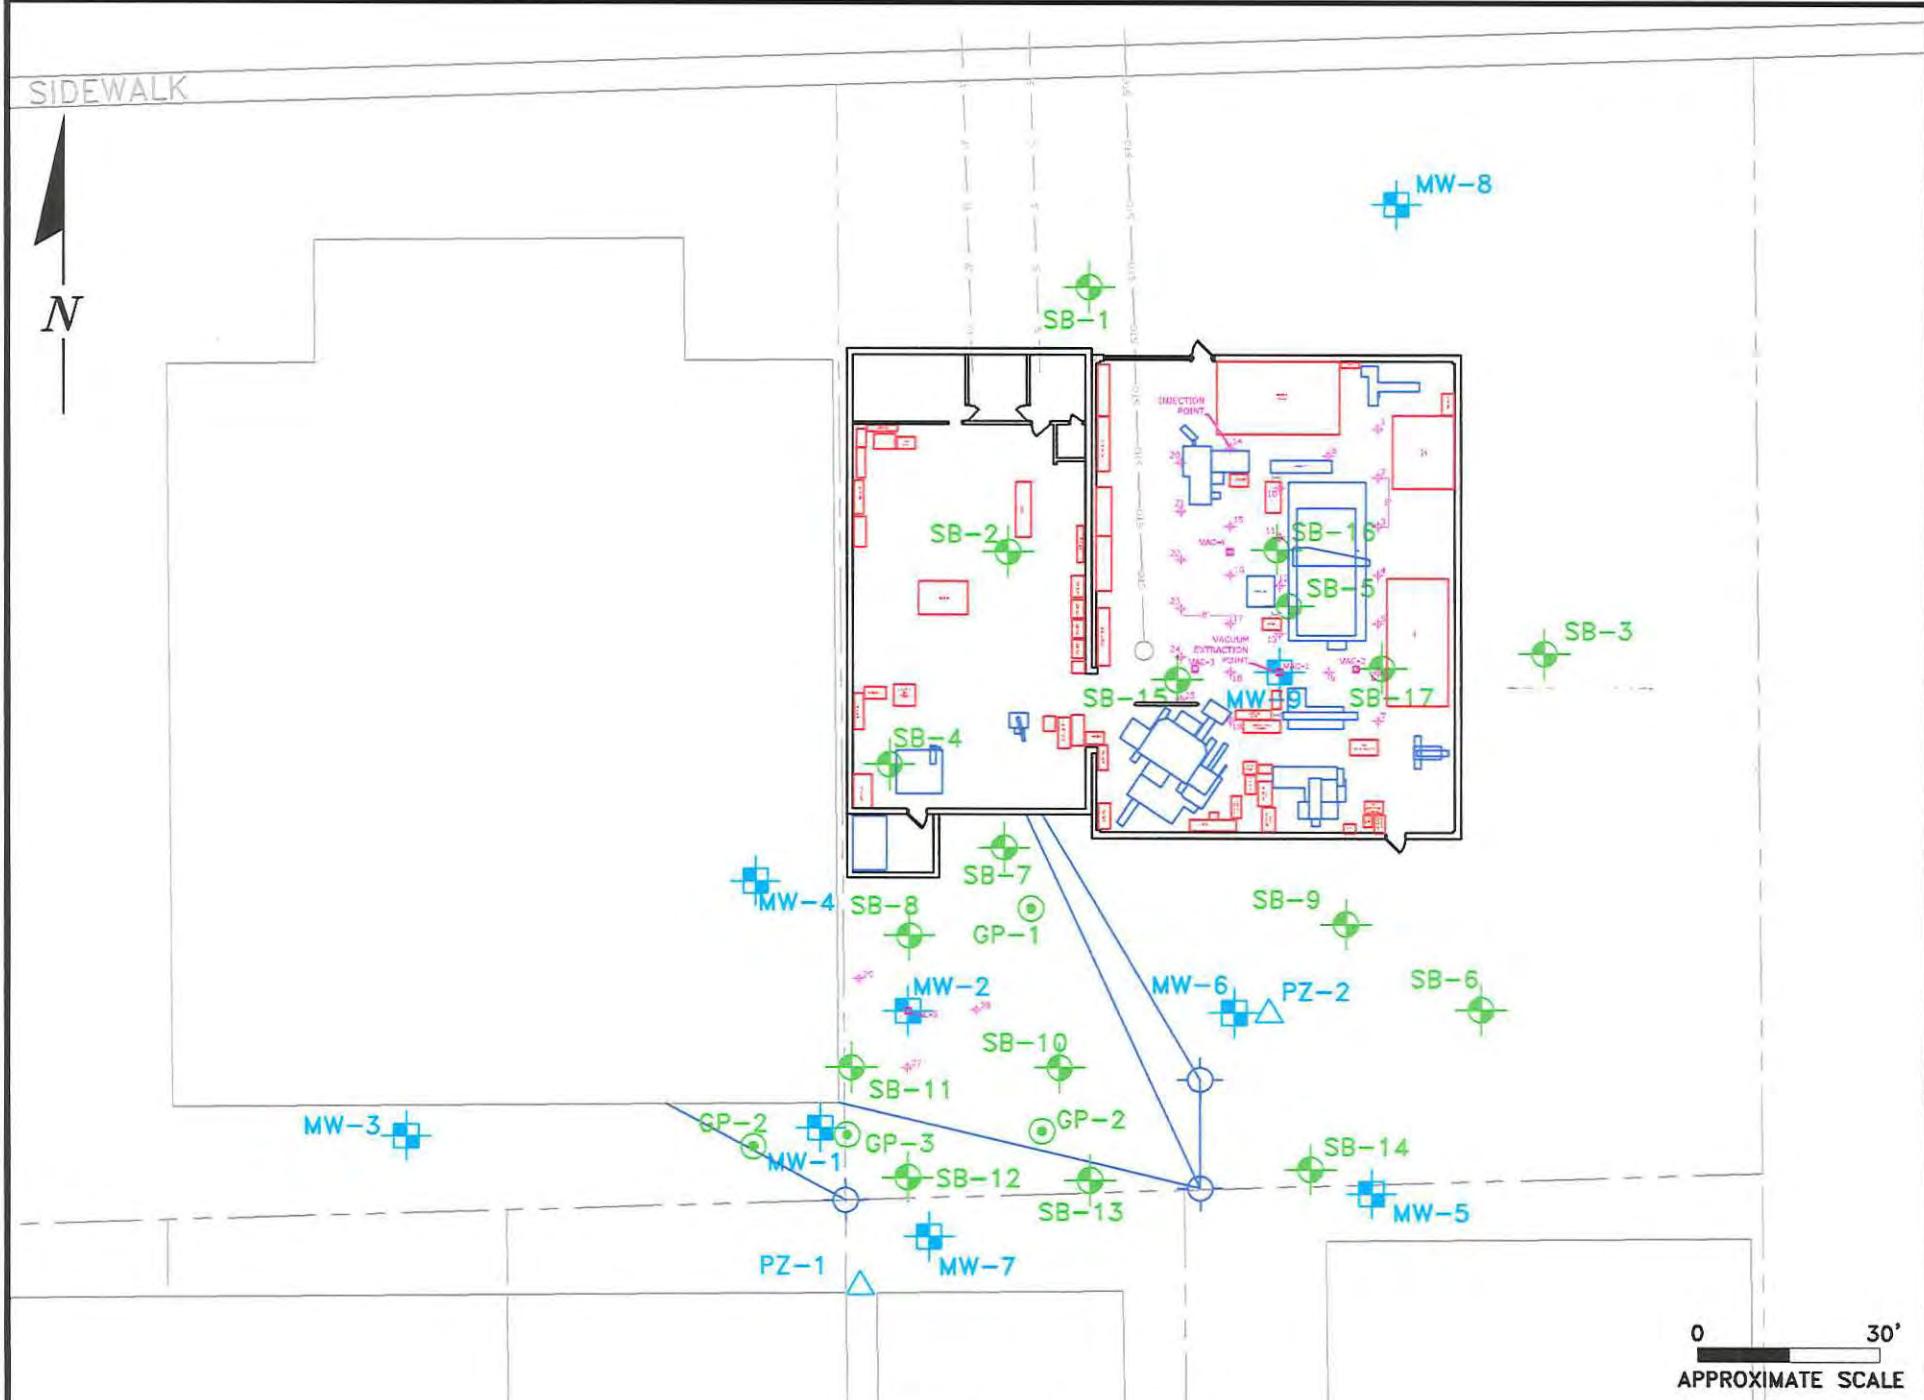

Sincerely,
KPRG and Associates, Inc.

Richard R. Gnat
