Introduction

The former Bask Dry Cleaners is located at 2136 East Moreland Boulevard in Waukesha, Wisconsin (the Site) (Figure 1). The former dry cleaner was located within a large strip mall (Westbrook Shopping Center). Previous investigations identified perchloroethene (PCE) contaminated soils primarily beneath the former dry cleaning building and an asphalt service drive located along the northern site boundary. The PCE contaminated soils were located in the vadose zone at a depth of approximately 10 to 20 feet below the land surface (ft bls). The groundwater was impacted with PCE, with the plume extending off-site to the north beneath residential properties on Capella Court (Figure 2). The concentrations of daughter products (trichloroethene, cis-1,2-dichloroethene, and vinyl chloride) were low, suggesting that little biodegradation had been occurring within the groundwater plume.

ARCADIS' July 6, 2006 proposed remedial action plan included operation of the soil vapor extraction (SVE) system to reduce the PCE mass in the vadose zone, post-remediation groundwater monitoring to support natural attenuation as a long-term remedy, and the use of institutional and engineering controls as part of the final closure. The groundwater PCE analytical data collected during the remedial investigation activities (through 2005), indicated stable to decreasing concentration trends. Thus, ARCADIS' proposal strategy was to remove contaminant mass in the soil, and document that the groundwater concentrations would continue to demonstrate stable or decreasing trends with time.

Between the time of the remedial investigation and completion of the soil vapor extraction system operation, the PCE concentration in the groundwater increased in Monitoring Wells MW-5 and MW-6. MW-5 is located on-site and MW-6 is located off-Site approximately 110 feet north of the strip mall property boundary beneath residential properties on Capella Court. This increase in PCE concentration occurred during the time when significant PCE mass was being removed from the vadose zone through operation of the SVE system. In addition, the water levels have increased over three feet at most locations since remedial investigation data was collected in 2005.

ARCADIS believes that the change in depth to the shallow groundwater table was largely due to above-normal precipitation during the first half of 2008. Southeastern

Westbrook Shopping
Center/Former Bask Dry
Cleaners
Waukesha, Wisconsin
BRRTS# 02-68-297669

Wisconsin experienced record snowfalls totaling more than 100 inches during the winter of 2008. In June 2008, parts of southeastern Wisconsin received over 7 inches of rain in a two-day period and over 13 inches of rain for the month. We believe that the rise in water levels resulting from this precipitation caused PCE that was formerly trapped within the vadose zone and capillary fringe to re-dissolve, thereby causing an increase in PCE concentrations in groundwater.

ARCADIS submitted a report to the Wisconsin Department of Natural Resources (WDNR) dated August 8, 2008, documenting the completion of 6 months of SVE and groundwater monitoring activities at the Site. The PCE contaminated soil within the recently-saturated vadose zone appears to be partitioning into the surrounding groundwater, resulting in higher PCE groundwater concentrations in the off-site portion of the plume. The increase in PCE groundwater concentrations does not support natural attenuation as a long-term remedy for groundwater, as was originally proposed for this project. ARCADIS recommends implementation of an active groundwater remediation strategy to address the dissolved phase PCE.

Site Background

Site Location and Description

The Westbrook Shopping Center is located at 2136 East Moreland Boulevard in Waukesha, Wisconsin. The former Bask Dry Cleaners tenant space is currently occupied by Milwaukee PC, a computer retail and service business. An asphalt drive is located between the building and the northern Site border. Residential properties are located further north, and the topography slopes downward north of the Site. The Site layout is illustrated on Figure 2.

The Sigma Group (Sigma) completed a site investigation from 2002 through 2005. The primary source of the PCE release appeared to be from a sanitary sewer located approximately 150 feet northwest of the former dry cleaner. Soil borings, monitoring wells and piezometers installed at the Site are shown on Figure 2. The soil analytical results obtained to date are summarized on Figure 3 and the groundwater analytical results to date are summarized in Table 1. The following bulleted list summarizes the pre-remediation Site conditions as documented from Sigma's investigation activities:

- Chlorinated volatile organic compounds-impacted soil (primarily PCE) was located beneath the former dry cleaner and beneath the asphalt service drive along a portion of the sanitary sewer (Figure 3). Impacted soil beneath the former dry

Westbrook Shopping
Center/Former Bask Dry
Cleaners
Waukesha, Wisconsin
BRRTS# 02-68-297669

cleaner was limited in extent, with the highest PCE concentration at 10 to 12 ft bls. Impacted soil beneath the asphalt service drive was defined to an approximate 2,200 square foot area, with the highest PCE concentrations at approximately 14 to 20 ft bls.

- The PCE-impacted groundwater extended north beneath residential properties on Capella Court. The data collected over a three year groundwater monitoring period (2002-2005) indicated decreasing concentration trends.
- The depth to the shallow groundwater table ranged from approximately 19 to 29 ft bls in the on-site wells and 7.5 to 15.5 ft bls in off-site wells. The difference in the depth to water is due in large part to the surface topography, which slopes downward off-site to the north beneath the residential dwellings. The shallow groundwater flow direction has been consistently north to northeast toward the residential properties on Capella Court.
- Groundwater flow velocities beneath the dry cleaner and within the source area were estimated to be 0.3 and 0.9 feet per day north, respectively.
- Piezometers PZ-1 through PZ-3 were installed to depths ranging from 45 and 60 ft bls and screened within the confining clay that underlies the saturated sand zone. Historical monitoring has indicated Piezometers PZ-2 and PZ-3 have generally been dry, with a small amount of groundwater observed in PZ-1. This data suggests that the underlying clay provides a barrier to vertical migration and represents the base of this water-bearing unit. The presence of an underlying aquitard would also indicate that the primary contaminant migration pathway through groundwater would be horizontal rather than vertical.
- A vapor intrusion study was completed as part of the investigation, and the analytical data were below United States Environmental Protection Agency screening criteria. Concentrations of PCE detected in the soil vapor samples did not warrant additional vapor sampling at the residential properties as part of the site investigation.

The WDNR issued a letter dated February 17, 2006 stating that the site investigation was complete.

Remediation Activities

ARCADIS implemented the WDNR-approved SVE remedial strategy in October 2006. Five vapor extraction wells were installed and an SVE system was operated for a period of six months. More detailed information regarding the system operation is included in the ARCADIS report titled "*Remediation Progress Report and Pilot Test Work Plan*" dated August 8, 2008. The SVE system removed an estimated 18.7 pounds of VOCs from the vadose zone soils. The zone of vacuum influence from Vapor Extraction Well VE-2 encompassed the entire soil source area, extending downgradient to off-site Monitoring Well MW-6.

Groundwater analytical results from the February and June 2008 sampling events indicated that PCE concentrations in Monitoring Wells MW-4, MW-5, and MW-6 increased significantly from the pre-remedial conditions reported in October 2005 and March 2007. However, PCE concentrations were either stable or decreasing in the remaining monitoring wells.

August Groundwater Sample Collection and Water level Measurements

In response to the ARCADIS "*Remediation Progress Report and Pilot Test Work Plan*", WDNR issued a letter dated August 19, 2008. The letter requested that the following activities be performed:

- Sample all of the groundwater monitoring wells for VOCs.
- Provide a brief report of the results including an updated historic groundwater analytical results table and historic groundwater elevation data table.
- Provide an evaluation of how the unexpected increase in contaminant concentrations affects potential receptors in the area of the Site.

In accordance with the WDNR letter, ARCADIS sampled the monitoring wells and piezometers across the study area on August 25, 2008. The wells and piezometers were sampled using low-flow sampling techniques similar to previous sample collection events. Prior to sampling, the depth to water at each well and piezometer was measured. A summary of the current and historical groundwater VOC analytical results are presented on Figure 4 and in Table 2. Table 3 presents a summary of the depth to water measurements collected from the site. The laboratory analytical report for this sample collection event is included in Appendix B.

Westbrook Shopping
Center/Former Bask Dry
Cleaners
Waukesha, Wisconsin
BRRTS# 02-68-297669

The PCE concentration in MW-6 decreased during the remedial investigation monitoring from 215 micrograms per liter ($\mu\text{g}/\text{L}$) in September 2003 to 35 $\mu\text{g}/\text{L}$ in October 2005. Since that time, this well has shown a steady increase in PCE concentration;

- 48 $\mu\text{g}/\text{L}$ in March 2007
- 270 $\mu\text{g}/\text{L}$ in February 2008
- 653 $\mu\text{g}/\text{L}$ in June 2008
- 1,250 $\mu\text{g}/\text{L}$ in August 2008

The last sample collection event conducted during the investigation showed a PCE concentration decrease in MW-5 (120 $\mu\text{g}/\text{L}$ in October 2005, down from 1,500 $\mu\text{g}/\text{L}$ during the previous sample collection event in March 2005). Since the October 2005 sample collection event, the PCE concentration in MW-5 has ranged from 1,840 $\mu\text{g}/\text{L}$ to 2,800 $\mu\text{g}/\text{L}$, higher than almost any time during the remedial investigation. The PCE concentrations in MW-10 exceeded the enforcement standard of 5 $\mu\text{g}/\text{L}$ until June 2008, when the concentration decreased to 2.8 $\mu\text{g}/\text{L}$. However, the PCE concentration increased to previous concentrations with the August 2008 sampling (10.2 $\mu\text{g}/\text{L}$).

ARCADIS prepared Mann-Kendall spreadsheets for Monitoring Wells MW-5, MW-6 and MW-10 (Appendix C). This statistical test was developed for petroleum products, but should be valid for chlorinated solvents when there is no significant accumulation of daughter products. The Mann-Kendall analysis indicates an increasing PCE trend at MW-5 and MW-6, and a stable trend at MW-10.

Monitoring Wells MW-5, MW-6 and MW-10 have contained PCE fairly consistently at concentrations exceeding the enforcement standard, and the concentrations at MW-5 and MW-6 have shown significant increases in 2008. It is important to note that all three of these monitoring wells are located off-site within a residential area.

The water table elevation appears to be decreasing after June 2008. This is consistent with the water table response during the drier summer months, and we would expect the water table to continue to lower through much of autumn. Figure 5 presents graphs showing depth to water and PCE concentration for Monitoring Wells MW-4, MW-5 and MW-6. The graphs also depict the soil analytical data collected at each of these locations. There appears to be a correlation between the water table passing through

Westbrook Shopping
Center/Former Bask Dry
Cleaners
Waukesha, Wisconsin
BRRTS# 02-68-297669

contaminated soil and an increase in the groundwater PCE concentrations. Since there appears to be little biological activity at this Site, the concentrations likely will not decrease while the water levels remain at the current levels.

Updated Receptor Analysis

The Site and surrounding area are serviced by the city of Waukesha municipal supply, and there are no drinking water wells within or immediately downgradient of the groundwater plume. Sigma noted that utilities likely would not act as receptors because the depth to the water table was greater than the depths of most utility corridors. This observation would appear to remain valid, although utilities beneath Capella Court may now be closer to the 2008 groundwater depths. The rise in the water table could result in an increased risk of vapor intrusion to the residential properties on Capella Court because the depth to water is closer to the lower levels of the residences, and the groundwater PCE concentrations have increased.

Chapter NR 726.05(2)(b) states that all sites that contain groundwater contamination exceeding enforcement standards must document that the following criteria are satisfied, including,

NR 726.05(1)(f). "The concentration and mass of a substance and its breakdown products in groundwater have been reduced due to naturally occurring physical, chemical and biological processes as necessary to adequately protect public health and the environment, and prevent groundwater contamination from migrating beyond the boundaries of the property or properties for which groundwater use restriction have been recorded..."

NR 726.05(2). "Natural attenuation will bring the groundwater into compliance with ch. NR 140 groundwater quality standards within a reasonable period of time, considering the criteria in s. NR722.07..."

NR 726.05(3). "The groundwater plume margin is stable or receding, and after case closure, groundwater contamination exceeding ch. NR 140 preventive action limits will not migrate beyond the boundaries of any property that ..." has a PAL exemption or for which a groundwater GIS has been registered.

Because of the significant increases in PCE concentration in MW-5 and MW-6 over time, and the absence of appreciable documented natural attenuation occurring at the Site, the potential for continued contaminant migration beyond the existing plume

Westbrook Shopping
Center/Former Bask Dry
Cleaners
Waukesha, Wisconsin
BRRTS# 02-68-297669

borders is high. The soil in the area is sand and silty sand, and appears to contain relatively low amounts of organic material, thus, there appears to be little natural ability to retard plume migration.

Conclusions and Recommendations

The groundwater concentrations in the downgradient portion of the plume continue to demonstrate increasing concentrations, and there appears to be little potential for natural attenuation to remediate the existing groundwater plume, as evidenced by the low concentrations of daughter products and the increase in PCE concentrations after vadose zone mass was removed through soil vapor extraction.

ARCADIS recommends that groundwater remediation be implemented for this Site to reduce the off-site concentrations to a point where the mechanical process of natural attenuation (dilution, volatilization, dispersion) will remediate residual impacts. The previous submittal outlined our approach for implementing groundwater remediation.

RE: Project: Bask & Decorah
Pace Project No.: 408314

Dear Brian Maillet:

Enclosed are the analytical results for sample(s) received by the laboratory on August 28, 2008. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tod Noltemeyer

PROJECT NARRATIVE

Project: Bask & Decorah
Pace Project No.: 408314

Method: EPA 8260
Description: 8260 MSV
Client: ARCADIS G & M
Date: September 04, 2008

General Information:

15 samples were analyzed for EPA 8260. All samples were received in acceptable condition with any exceptions noted below.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

Surrogates:

All surrogates were within QC limits with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: Bask & Decorah
Pace Project No.: 408314

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

Mann-Kendall Statistical Test

Form 4400-215 (2/2001)

Remediation and Redevelopment Program

Notice: This form is the DNR supplied spreadsheet referenced in Appendices A of Comm 46 and NR 746, Wis. Adm. Code. It is provided to consultants as an optional tool for groundwater contaminant trend analysis to support site closure requests under s. Comm 46.07, Comm 46.08, NR 746.07, NR 746.08, Wis. Adm. Code. Use this form or a manual method when seeking case closure under those rules. Earlier versions of this form should not be used.

Instructions: Do not change formulas or other information in cells with a blue background, only cells with a yellow background are used for data entry. To use the spreadsheet, provide at least four rounds and not more than ten rounds of data that is not seasonally affected. Use consistent units. The spreadsheet contains several error checks, and a data entry error may cause "DATA ERR" or "DATE ERR" to be displayed. Dates that are not consecutive will show an error message and will not display the test results. The spreadsheet tests the data for both increasing and decreasing trends at both 80 percent and 90 percent confidence levels. If a declining trend is present at 80 percent but not at 90 percent, a site is still eligible for closure under Comm 46 and NR 746 provided that other conditions in those rules are met. If an increasing or decreasing trend is not present, an additional coefficient of variation test is used to test for stability, as proposed by Wiedemeier et al, 1999. For additional information, refer to the Interim Guidance on Natural Attenuation for Petroleum Releases, dated October 1999. Refer to the guidance for recommendations on data entry for non-detect values.
