Re: Additional Work Plan and Budget Request – February 2015
Former Bask Dry Cleaners – Waukesha, WI
BRRTS# 02-68-297669, FID# 268188800

Dear Mr. Volkert:

Results from the most recent round of vapor and groundwater sampling were discussed with the Wisconsin Department of Natural Resources (WDNR) in a conference call on January 21, 2015. The WDNR requested that sub-slab depressurization systems (SSDSs) be installed at the Lex residence (2157 Rambling Rose Rd.) and the Stockinger residence (2151 Rambling Rose Rd.). In addition, KPRG and Associates, Inc. (KPRG) was directed to evaluate the most current groundwater impact map and the most current soil vapor map to determine where additional wells, if necessary, and vapor probes may need to be installed to complete definition of the areal extent of impacts. Once completed, a work plan and budget (to maintain dry cleaner environmental response fund [DERF] eligibility) is to be developed for additional work. The groundwater and vapor impacts are discussed separately below followed by an additional work plan and proposed budget.

Groundwater Evaluation

The most recent round of groundwater samples were collected on October 22, 2014. The groundwater elevation measurements are included in Table 1 and the data are summarized in Table 2 which includes historical data. Figure 1 provides the most recent groundwater flow map and Figure 2 provides isoconcentration contours based on that data for tetrachloroethene (PCE), trichloroethene (TCE) and cis-1,2 dichloroethene (DCE). The only vinyl chloride detection in the most recent sampling was 0.89 ug/l at well MW-5 which is within the source area.

A review of the groundwater impact map (Figure 2) indicates that the extent of groundwater impacts is well defined. The furthest downgradient monitoring well (MW-10) had a PCE detection of 11 ug/l which is just above the NR 140 Enforcement Standard (ES) of 5 ug/l. This indicates that well MW-10 is near the overall edge of the impact plume. At this location, TCE was detected at 4 ug/l (below the ES of 5 ug/l) and cis-1,2 DCE was detected at 12 ug/l (below the ES of 70 ug/l). This data suggests that the groundwater impact plume has been sufficiently defined and no additional groundwater monitoring wells are being proposed at this time.

A full round of groundwater samples will be collected concurrent with the below proposed soil vapor samples providing one concurrent data set for evaluation purposes.

Soil Vapor Evaluation

Table 3 summarizes all soil vapor sampling data to date. Figure 3 provides an isoconcentration contour map of soil vapor impacts. It indicates some elevated soil vapor impacts extending slightly northeast of the groundwater impact plume area. It is recognized that soil vapor impacts do not always mimic groundwater flow/impacts as the pathway allows for vapor migration through the unsaturated zone following potential fractures and/or more permeable soil seams without necessarily following a primary groundwater flow direction. Based on this map, SSDS systems will be installed at the Lex and Stockinger residences as previously noted above (2157 Rambling Rose Rd. and 2151 Rambling Rose Rd., respectively).

In addition to the SSDS installs noted above, another soil vapor probe (SV-12) is being proposed to complete the definition of the extent of soil vapor impacts to the northeast. The location of this probe is on the north side of Rambling Rose Rd as shown on Figure 3. If the vapor sampling at this location indicates impacts above standards, the installation of an additional monitoring well at this location may be considered.

For budget estimating purposes, the additional work provided below is divided into the following tasks:

- Task 1 – Additional Requested Work Planning/Coordination
- Task 2 – Additional SSDS Installations
- Task 3 – Additional Soil Vapor Probe Installation and Sampling
- Task 4 – Groundwater Sampling
- Task 5 – Additional Reporting

Each task is discussed separately below.

ADDITIONAL WORK PLAN SCOPE OF WORK

Task 1 – Additional Requested Work Planning/Coordination

The scope of this task includes the project management and planning that will be required for the successful completion of the additional work. This includes expanding the current property access agreements (or creating a new agreement(s)), with the Lex/Stockinger residences for SSDS installs, and the City of Waukesha for the additional soil boring/vapor probe in their property within the right-of-way of Rambling Rose Rd.

Task 2 – Additional SSDS Installs

Following the execution of the property access agreements, KPRG will meet with Radon Measurement & Elimination Services (RMES), a radon venting contractor that we have used extensively in the past, at the sites to obtain a more accurate cost estimate for the work. However, based on recent installations for other residents in the area, RMES is anticipating installing one vapor extraction point at the sump crock within the basement. RMES will install a new sump pump (if necessary), seal the crock with a clear see-thru lid, and use the crock and associated weeping tile system as the vapor depressurization system. A “point” will then be installed into the sealed crock and vented outside with an inline fan. Pressure Field Extension (PFE) testing will be performed to verify that the footprint of the structure is being sufficiently vented, assuming the resident allows for the additional holes to be drilled through the floor for testing. The RMES estimated cost for each SSDS, including electrical hookups and subsequent pressure/vacuum testing beneath the floor slab to document the effectiveness of the system to draw vapor, is \$2,700. The detailed cost breakdown sheets use \$3,700 for contractor cost allowing for some additional money in case of unexpected field installation condition/issues. It is KPRG’s understanding that due to the nature of this response action, obtaining three bids for this work will not be required. Each system installation will require up to two days to install and one day for testing.

The WDNR has also requested that a follow-up indoor air sample be collected from within each basement approximately three months after SSDS installations. The cost of two additional ambient air samples is included within the proposed budget.

Task 3 – Additional Soil Vapor Probe Installation and Sampling

Soil Vapor Probe Installation Procedure

One additional soil vapor probe will be installed using the direct push Geoprobe drilling method. One boring, SV-12, will be advanced within the right-of-way of Rambling Rose Rd (see Figure 3). The location of the probe is intended to assist in defining the potential extent of soil vapor impacts.

The borehole will be advanced to a depth of approximately ten feet below ground surface (bgs), or groundwater, whichever is shallower. A 1-inch diameter, schedule 40 PVC probe will be placed down hole with 3-feet of 0.010-slot screen. Clean silica sand will be placed around the screen to approximately six inches above the top of the screen. The remainder of the borehole will be backfilled with bentonite pellets and hydrated. The surface casing will be completed as a flush mount and the top of the PVC riser will be finished with an air-tight cap having a fitting to allow for vapor sample collection.

Not less than 24 hours after probe installation, the integrity of the probe seal will be tested by placing an approximately 4' by 4' section of visqueen over the ground with a hole in the center placed over the vapor probe. A plastic pail will be sealed with the visqueen over the hole and vapor probe and the atmosphere within the pail will be enriched with helium covering the entire sampling apparatus. Approximately two probe volumes of air will be purged and a vapor sample will be monitored directly for the presence of helium using an Alcatel ASM 142S, or equivalent, detector/field monitor. If no helium is detected, the probe construction will be deemed adequate for subsequent vapor sampling. If helium is detected, the probe surface seal will be re-enforced and tested again until a sufficient seal is documented. If for some reason the seal can not be adequately completed, the vapor point will be properly abandoned and redrilled/constructed within five feet of the original location.

Vapor Probe Sampling Procedure

Once an adequate surface seal is documented, a soil vapor sample will be collected from the new vapor point along with all the other vapor probes already installed (points SV-1B thought SV-11) using a Summa canister with a one-hour flow control valve at each location. This will yield a total of 12 soil vapor samples. Approximately two vapor probe volumes of air will be purged from the probe. A disposable polyethylene sampling tube will then be connected from the probe sampling fitting to the Summa canister. The canister valve will be opened and a one-hour vapor sample will be collected. Once the canister is full, the valve will be closed and the canister will be disconnected from the sampling tube. The Summa canisters will then be shipped under a properly completed chain-of-custody (COC) for analysis to a Wisconsin certified laboratory.

Field notes will be maintained during each sampling event which will include the weather conditions, ambient air photoionization detector (PID) measurements and a description of any potential odors in the ambient air or other conditions that may be deemed pertinent.

Analytical Requirements

The Summa canister samples will be analyzed using the TO15 analytical method. Since the constituent of concern at this site is tetrachloroethene (PCE), the lab will be requested to only report the chlorinated volatile organic portion of the TO15 scan which will include PCE and its breakdown products of TCE, cis-1,2-dichloroethene (DCE) and vinyl

chloride as well as 1,1,1-TCA and its breakdown product of 1,1-dichloroethane (DCA) and 1,1-DCE.

As noted above, all sample collection, handling and analysis will be performed in accordance with the approved Work Plan for the work previously completed.

Task 4 – Groundwater Sampling

This proposal assumes one additional round of groundwater sampling to include the monitoring wells previously sampled (MW-1, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, MW-10, MW-11 and PZ-1). PZ-2 which is clustered adjacent to well MW-5 has been historically dry. This well will be checked for the presence of water. If water is encountered, it will also be sampled. All samples will be analyzed for VOCs at the laboratory and field measurements of dissolved oxygen (DO), temperature, pH, specific conductivity and oxidation-reduction potential (ORP) will be gathered and recorded. One duplicate sample will be analyzed for VOCs per sampling event for quality assurance/quality control purposes.

Task 5 – Additional Reporting

This task covers the additional effort in tabulating, evaluating and reporting the added data. This includes tables, figures and text discussions for both groundwater and soil vapor impacts.

PATHWAY TO CLOSURE

It is our understanding that once all the SSDS systems are in place and required follow-up indoor air sampling data shows no impacts, the groundwater data continues to indicate that the plume is stable or receding, and the additional vapor sampling (new probe included) defines the extent of vapor impacts, that the site will be ready for conditional closure. If the new set of data provides information that additional work is necessary, discussions will be held with WDNR to define further scope.

COST ESTIMATE

Costs are summarized in Table 4 and detailed on the costing sheets in Attachment 1. The additional requested budget for the above defined scope of work is \$29,899. The unit rates used in this cost estimate are consistent with previous KPRG rates. One round of soil vapor probe sampling is assumed.

Only those costs incurred will be billed. All billing will be performed on a monthly basis and will be broken down by task and unit rates. No additional work will be performed until formal WDNR approval of the proposed budget is received. If there are any questions, please contact me at 262-781-0475.

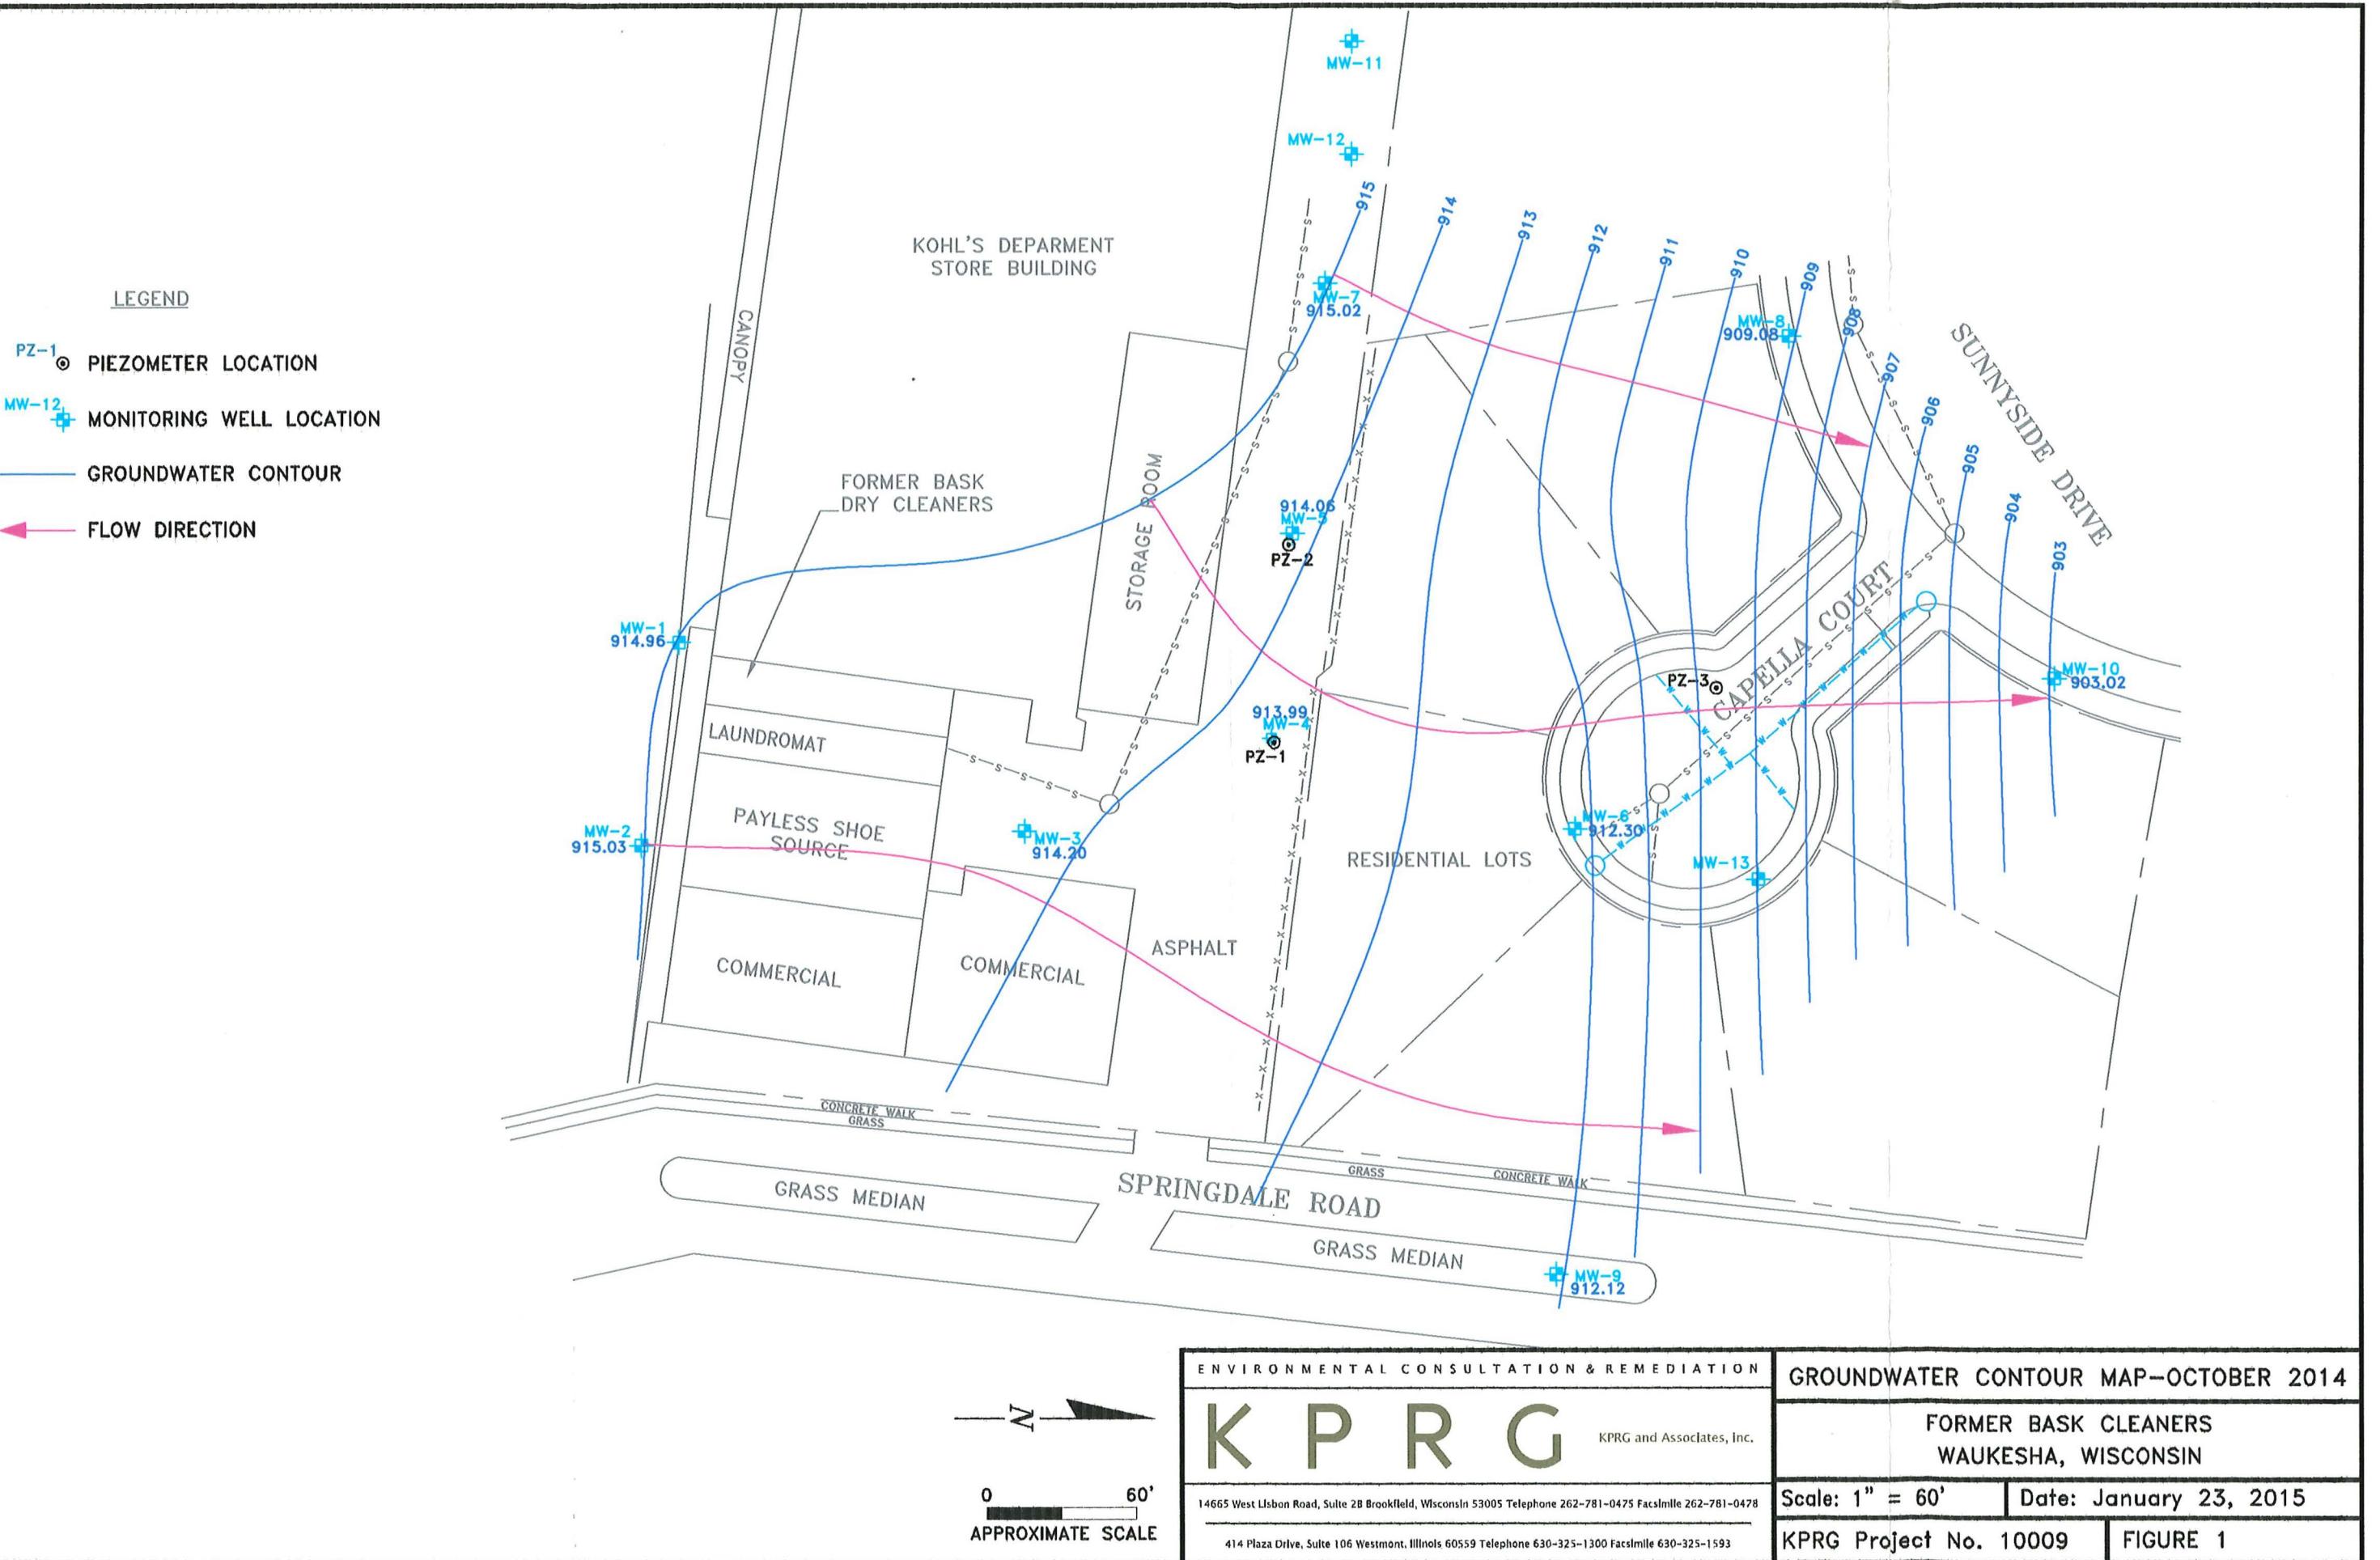

Sincerely,
KPRG and Associates, Inc.

Richard R. Gnat, P.G.
