RE: Summary of Limited Environmental Assessment Findings
Bishop's Creek Family Housing LLC by CommonBond Investment Corp.
32nd and Hampton
Milwaukee, Wisconsin

FID 341055770
Bmts 02-41-306192

Dear Ms. Higgins:

INTRODUCTION

Sigma Environmental Services, Inc. (Sigma) was retained by CommonBond Investment Corp. to complete limited environmental investigation activities within the footprint of the proposed Bishop's Creek Family Housing development (Bishop's Creek) (as presented in the June 19, 2008 project plan). The purpose of the environmental investigation activities was to assess current site conditions given the historic uses of the property for leather tanning and material storage and the documented presence of subsurface impacts. This letter presents the results of the completed environmental investigation activities along with recommendations based on these results.

BACKGROUND

The site is located in the northwest ¼ of the northeast ¼ of Section 1, Township 7 North, Range 21 East in the City of Milwaukee, Milwaukee County Wisconsin. The site is located on the southwest corner of the intersection between W. Hampton Avenue and N. 32nd Street. The proposed Bishop's Creek property occupies approximately 0.80 acres of the existing site (*Figure 1*).

Environmental investigation activities were conducted between June 23 and June 30, 2008 to assess the site conditions relative to historic uses. The scope of activities, results and recommendations are presented below.

SCOPE OF WORK

Sigma on behalf of the CommonBond Investment Corp. completed the following:

- 1) Advanced six hollow stem auger/Geoprobe soil borings (SMW-1 through SMW-3 and SSB-1 through SSB-3) to depths between 15 to 30 feet below the ground surface (bgs),
- 2) Completed one power auger soil boring (SHA-1) to a depth of 9 feet bgs,

- 3) Collected and submitted two soil samples from each soil boring location for laboratory analysis of volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PAHs), total lead, hexavalent chromium, trivalent chromium, and arsenic. Soil samples collected along the eastern property boundary (from soil borings SMW-1 and SMW-3) were also submitted for polychlorinated biphenyls (PCBs) analysis,
- 4) Collected groundwater levels from existing, accessible and viable groundwater monitoring wells including: MW-20, MW-21, MW-23, MW-24, MW-30, MW-32, MW-33, and MW-35,
- 5) Completed two soil borings (SMW-1 and SMW-2) as Ch. NR 141 compliant groundwater monitoring wells, completed one soil boring (SMW-3) as a temporary groundwater monitoring well,
- 6) Collected water level measurements from and developed monitoring wells SMW-1 and SMW-3 in accordance with Ch. NR 141,
- 7) Collected and submitted groundwater samples from monitoring wells SMW-1 and SMW-3 for laboratory analysis of VOCs, dissolved lead, dissolved chromium (total, hexavalent and trivalent), dissolved selenium, and dissolved sulfate. A groundwater sample from monitoring well SMW-3 was also submitted for laboratory analysis of PAHs, and
- 8) Surveyed the new monitoring well and soil boring locations relative to the State Plane Coordinate System.

The activities completed in June 2008 provide the following results.

INVESTIGATION ACTIVITIES

Sigma's Standard Operating Procedures for field activities are included in *Attachment A*.

Soil Boring Completion

On June 23 and 24, 2008 four hollow stem auger soil borings (SMW-1 and SSB-1 through SSB-3) and one power auger boring (SHA-1) were completed within the footprint of the proposed Bishop's Creek development. On June 27, 2008 two Geoprobe soil borings (SMW-2 and SMW-3) were also completed within the footprint of the development. The soil borings were placed in locations where no soil analytical data had been collected previously (SMW-1 through SMW-3, SSB-1, and SSB-2), to assess subsurface conditions adjacent to current and proposed property boundaries (SMW-2, SMW-3, SSB-2, and SHA-1), and/or to assess conditions adjacent to previously identified areas of concern (SSB-3 and SHA-1). The hollow stem auger and Geoprobe soil borings were advanced to depths between 15 to 30 feet bgs. The power auger soil boring was advanced to a depth of 9 feet bgs. Soil boring locations are presented on *Figure 1*.

During boring advancement, soil samples were collected on a continuous basis and described on the basis of color, texture, grain size, and plasticity, and classified in accordance with the USCS. The soil classifications, sampling intervals, and descriptions are presented on the Soil Boring Logs in *Attachment B*.

Soil samples were collected from each sampling interval and containerized for headspace analysis using an organic vapor monitor (OVM) (11.7 eV lamp) that was periodically calibrated for direct response to 250 ppm isobutylene in air. Field screening results are presented on Soil Boring Logs in *Attachment B*.

Soil samples were also collected from each sample interval, containerized and preserved (where necessary) for potential laboratory analysis of one or more of the following analytes: VOCs, PAHs, lead, hexavalent chromium, trivalent chromium, arsenic, and PCBs. Select soil samples, accompanied by a chain-of-custody document, were submitted to Synergy Environmental Lab, Inc. of Appleton, WI for analysis based on field screening results and observations. Soil samples selected for laboratory submittal were generally based on the highest OVM measurement, the location within four feet of the ground surface or the location near the interpreted shallow groundwater table.

Soil borings that were not converted to groundwater monitoring wells (SSB-1 through SSB-3 and SHA-1) were properly abandoned in accordance with Ch. NR 141 following completion of soil sampling activities. Borehole abandonment forms are included in *Attachment C*.

Monitoring Well Installation

Following completion of soil borings SMW-1 and SMW-2, Ch. NR 141 compliant groundwater monitoring wells were installed in each boring. The monitoring wells were constructed with a 15-foot length of two-inch diameter PVC screen (0.010 machine slotted) connected to an appropriate length of two-inch diameter PVC riser pipe. The screen was positioned to intersect the groundwater table as observed during the drilling activities. Monitoring well construction forms (WDNR Form 4400-113A) are included as *Attachment D*.

Due to physical site limitations (i.e. overhead power lines) and project schedule requirements, a temporary monitoring well was installed at the location of soil boring SMW-3. The temporary groundwater monitoring well was constructed with a 15-foot length one-inch diameter PVC screen (0.010 machine slotted) connected to an appropriate length of one-inch diameter PVC riser pipe. The screen was positioned to intersect the groundwater table as observed during the drilling activities.

Monitoring Well Development

Well development activities were completed in accordance with Chapter NR 141 to remove fine sediment from the monitoring well annulus and filter pack and to establish a hydraulic connection with the surrounding formation. On June 30, 2008 monitoring well SMW-1 and temporary monitoring well SMW-3 were developed prior to sampling. Groundwater has not entered monitoring well SMW-2; therefore, SMW-2 was not developed or sampled at the time of this report. Monitoring well development forms (WDNR Form 4400-113B) are included as *Attachment E*.

Static Water Level Measurement

Static water levels were obtained from the monitoring well network to determine the horizontal groundwater flow direction. The water levels were measured with an electronic

water level indicator to the nearest one-hundredth of a foot and were referenced to the surveyed monitoring well top of casing elevation.

Groundwater Sampling and Analysis

Groundwater samples were collected from monitoring wells SMW-1 and SMW-3 on June 30, 2008. Monitoring well SMW-2 was not sampled due to the lack of groundwater in this well. Groundwater samples from monitoring wells SMW-1 and SMW-3 were submitted for laboratory analysis of VOCs, dissolved lead, dissolved chromium (total, hexavalent, trivalent), dissolved selenium, and dissolved sulfate. A groundwater sample from well SMW-3 was submitted for laboratory analysis of PAHs; however, due to the relatively large volume of sample required for PAH analysis, Sigma was not able to collect enough groundwater from monitoring well SMW-1 to submit a sample for PAH analysis until July 7, 2008.

A duplicate groundwater sample and equipment blank were also submitted during the groundwater sampling events for quality assurance/quality control purposes. Duplicate groundwater samples were collected as a means to measure laboratory precision. Equipment blanks were analyzed to determine if contaminants infiltrated the sample during transportation or field procedures. Groundwater samples were submitted to Synergy Environmental Lab, Inc. for analysis of VOCs, PAHs, and dissolved sulfate. Groundwater samples were submitted to Test America of Watertown, WI for analysis of dissolved metals due to the relatively short sample hold time for dissolved hexavalent chromium analysis.

Investigative Waste Handling

All soil cutting produced during Sigma's subsurface investigation activities have been containerized in labeled steel 55-gallon drums and staged on site adjacent to monitoring well SMW-1 pending receipt of laboratory analytical results. Purge water from monitoring well development and sampling has also been containerized in a sealed 5 gallon bucket and staged adjacent to the soil drums pending receipt of laboratory analytical results.

INVESTIGATION RESULTS

Geology

Based on information obtained during Sigma's subsurface investigation, the site appears to be covered with three to six feet of fill comprised of sandy silty clays and sandy clayey silts containing varying amounts of gravel. The lithology beneath the fill material generally consists of deposits of fine silty clays or clayey silts to the maximum depth investigated (30 feet bgs). The specific soil characteristics and depths encountered during drilling activities are shown on the soil boring logs in *Attachment B*.

Hydrogeology

During groundwater sampling activities from the newly installed monitoring wells (SMW-1 and SMW-3) slow water recovery was noted, in general. Based on the static groundwater elevations measured in existing monitoring wells MW-20, MW-21, MW-23, MW-24, MW-

30, MW-32, MW-33, and MW-35, groundwater is interpreted to flow to the south. Groundwater elevations are presented in *Table 1*. A groundwater contour map is included as *Figure 2*.

Soil Analytical Results

A total of fifteen soil samples collected at the site were submitted for laboratory analysis of one or more of the following parameters: VOCs, PAHs arsenic, trivalent chromium, hexavalent chromium, lead, and PCBs.

VOCs Discussion: Review of the soil analytical results indicate that various petroleum VOC constituents were reported at concentrations greater than laboratory method detection limits in the soil samples collected from soil boring SSB-1 at a depth between 1 to 3 feet bgs, from soil boring SSB-3 at depths between 1 to 3 and 5 to 7 feet bgs, and from soil boring SHA-1 at a depth between 1 to 3 feet bgs. The reported ethylbenzene and xylenes concentrations in the soil sample collected between 5 to 7 feet bgs in soil boring SSB-3 exceeded applicable Ch. NR 720 Generic Residual Contaminant Levels (RCLs) for the protection of groundwater. The reported concentration of ethylbenzene in this soil sample also exceeded the Ch. NR 746 Table 1 Soil Screening Level (SSL). No other VOCs were reported at concentrations greater than applicable RCLs.

PAHs Discussion: Detectable concentrations of one or more PAH constituents were reported in all soil samples collected from soil borings and submitted for laboratory analysis of PAHs. Applying the WDNR Interim PAH Generic RCLs for both the protection of groundwater standards and the non-industrial direct contact pathway standards show that there are up to six PAH compounds that exceed protection of groundwater standards or the non-industrial direct contact pathway standards when a target risk factor of 1×10^{-6} is used (per s.NR 720.19(5)(a)) to calculate the direct contact RCLs:

- The soil samples collected between 1 to 3 feet bgs in soil boring SSB-1 and 1 to 3 feet bgs in soil boring SHA-1 contained reported concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene greater than the Interim Guidance RCLs for the direct contact pathway at a non-industrial site and reported concentrations of phenanthrene greater than the Interim Guidance RCLs for protection of groundwater.
- The soil samples collected between 2 to 4 feet bgs in soil boring SMW-2 and 7 to 9 feet bgs in soil boring SSB-1 contained reported concentrations of benzo(a)pyrene greater than the Interim Guidance RCL for the direct contact pathway at a non-industrial site.

All other detected PAH concentrations were below applicable standards.

RCRA Metals: Concentrations of arsenic were reported greater than the Ch. NR 720 RCL for direct contact at a non-industrial site in all soil samples submitted for laboratory analysis of arsenic. The majority of the reported arsenic concentrations are typical of background concentrations at sites in southeastern Wisconsin (generally around 10 mg/kg); Detected concentrations of arsenic in soil samples collected between 1 to 3 feet bgs in soil borings SSB-3 (20 mg/kg) and SHA-1 (23 mg/kg) were slightly greater than typical

background levels but are not assumed associated with a point source given the relatively low concentrations, consistency with analytical results of previously completed subsurface investigation activities, and horizontal distribution. The slightly elevated arsenic concentrations may be associated with shallow fill material.

Concentrations of lead greater than the Ch. NR 720 RCL for direct contact at a non-industrial site were reported in soil samples collected from boring SSB-1 (1 to 3 feet bgs), SSB-3 (1 to 3 feet bgs), and SHA-1 (1 to 3 feet bgs).

No other RCRA Metal concentrations were reported greater than applicable standards.

PCBs: PCBs were not reported at concentrations greater than laboratory method detection limits in soil samples collected from soil boring SMW-1. The soil sample collected between 6 to 8 feet bgs from soil boring SMW-3 contained Arochlor-1260 at a reported concentration of 0.040 mg/kg, less than the US EPA Preliminary Remediation Goal (PRG) for soil at a residential site (0.22 mg/kg). A soil sample collected between 2 to 4 feet bgs from soil boring SMW-3 has also been submitted for laboratory analysis of PCBs; analytical results are pending at the time of this report.

Sigma's soil laboratory analytical results for the site are summarized in *Table 2*. Copies of the soil laboratory analytical reports are included in *Attachment F*. A soil quality map is included as *Figure 3*.

Groundwater Quality Results

Groundwater samples from groundwater monitoring wells (SMW-1 and SMW-3) were submitted for laboratory analysis of the following parameters: VOCs, PAHs, dissolved chromium – total, trivalent, and hexavalent, dissolved lead, dissolved selenium, and dissolved sulfate. Groundwater monitoring well SMW-2 remains dry at the time of this report; therefore, no groundwater samples were collected from this well.

VOCs: Review of the laboratory analytical results indicate that the only VOC constituent reported at a concentration greater than laboratory method detection limits in groundwater samples collected from site monitoring wells is p-isopropyltoluene in the sample from monitoring well SMW-3. The reported concentration of p-isopropyltoluene was flagged by the analytical laboratory as between the Limit of Detection and Limit of Quantitation.

PAHs: The groundwater sample collected from monitoring well SMW-3 contained a reported concentration of benzo(b)fluoranthene that was greater than the Ch. NR 140 Enforcement Standard (ES). The sample from SMW-3 also contained reported concentrations of benzo(a)pyrene and chrysene greater than applicable Ch. NR 140 Preventive Action Limits (PALs). It is important to note that although the groundwater quality data from temporary well SMW-3 has been reviewed and compared to regulatory standards, SMW-3 was constructed as a temporary well and the analytical results may not be representative of actual groundwater conditions. As noted above, a groundwater sample for laboratory analysis of PAHs has been collected; however, analytical results are not available at the time of this report.

Dissolved RCRA Metals: Concentrations of dissolved chromium, lead, and selenium were not reported at concentrations greater than the Ch. NR 140 PALs in the groundwater samples collected from wells SMW-1 and SMW-3. Hexavalent chromium was not reported at concentrations greater than laboratory method detection limits.

Sulfate: The sulfate concentration reported in the groundwater sample collected from monitoring well SMW-1 was greater than the Ch. NR 140 ES. The reported concentration of sulfate in the groundwater sample collected from monitoring well SMW-3 was less than the Ch. NR 140 PAL.

A duplicate groundwater sample, collected from SMW-3 and submitted for laboratory analysis of VOCs, contained a reported concentration of chloromethane (0.67 ug/L), a typical laboratory contaminant, that was flagged by the analytical laboratory as between the Limit of Detection and Limit of Quantitation. This constituent was not detected in any other groundwater samples or lab blanks. The trip blank submitted with the groundwater samples did not contain VOCs greater than laboratory method detection limits.

Groundwater analytical data are summarized in *Table 3*. Copies of the groundwater laboratory analytical reports are included in *Attachment G*.

SOIL DISCUSSION / RECOMMENDATION

Review of the site specific physical and chemical characteristics indicates that soil containing concentrations of select PAH constituents and lead at concentrations greater than RCLs for the direct contact pathway are present at the site. In addition, concentrations of ethylbenzene and xylenes were reported at concentrations greater than protection of groundwater RCLs with the reported concentration of ethylbenzene greater than the Ch. NR 746 Table 1 SSL in the soil sample collected between 5 to 7 feet bgs in soil boring SSB-3. The detected impacts are generally consistent with data from previous subsurface investigation activities completed at the site: residual PVOC impacts were previously reported in a soil sample collected from soil boring SB-2, adjacent to soil boring SSB-3, and residual PAH impacts were previously reported in shallow soil samples collected from the open yard area in the vicinity of SSB-1.

The specific source or sources of the residual soil impacts are unknown and no previously unidentified potential sources were discovered during the course of Sigma's investigation activities. The horizontal extent of the residual PVOC impacts identified in soil samples collected from soil boring SSB-3 has not been defined; vertically, the residual PVOC impacts appear to be limited to within approximately 6 feet of the existing ground surface and do not appear to have migrated into the silty clay material observed at depths greater than 6 feet bgs.

Based on the current development plan for the site, the majority of the residually impacted materials will be located beneath buildings or pavement, which may serve as engineered barriers. Materials excavated as part of site grading activities or building or utility construction that cannot be reused on site will most likely require off-site disposal as a special waste.

Reported concentrations of lead and PVOCS in soil samples collected from soil boring SSB-3, in the area of the proposed playground, will require remedial action. Potential remedial actions to address the residual impacts in the area of the proposed playground include excavation of material within 4 feet of the proposed finish grade and replacement with clean, imported fill or the construction of an engineered barrier system as part of development activities.

The reported concentration of ethylbenzene in a soil sample collected from soil boring SSB-3 exceeded the Ch. NR 746 Table 1 SSL, which is supposed to be an indicator of free product, and the horizontal extent of residual PVOCS impact has not been defined at this location. The potential for volatile vapor migration along preferential migration pathways or utility lines was not evaluated during Sigma's investigation activities. If utility lines are located in areas of residual VOC contamination, appropriate measures may be required to address potential vapor migration.

GROUNDWATER DISCUSSION/RECOMMENDATION

Based on measured static water levels, the shallow groundwater beneath the site is interpreted to flow to the south; however, no groundwater elevation data is available beneath the existing buildings. Local shallow groundwater flow may be influenced by the presence of underground utility corridors, building foundations, and other below grade structures and shallow groundwater flow conditions should be reevaluated following site redevelopment.

Impacts to groundwater beneath the site appear to be limited to select PAH constituents greater than Ch. NR 140 ESs or PALs in the groundwater sample collected from temporary monitoring well SMW-3 and sulfate greater than the Ch. NR 140 ES in the groundwater sample collected from monitoring well SMW-1. Based on the reported concentrations of groundwater impacts in groundwater samples collected from site monitoring wells to date, natural attenuation would likely be an applicable and appropriate remedial approach. Additional groundwater monitoring will be required to demonstrate stable or decreasing trends in contaminant concentrations.

No contaminants clearly associated with previously identified sources of contamination (tanning vats located in Building 10, underground storage tanks (USTs) located adjacent to Buildings 16 and 17) were observed during completion of Sigma's subsurface investigation activities.

Notes:

1. µg/kg = micrograms per kilogram (equivalent to parts per billion, ppb)
2. mg/kg = milligrams per kilogram (equivalent to parts per million, ppm)
3. NA = not analyzed
4. GW RCLs = Groundwater Residual Contaminant Levels based on the following:
 For petroleum hydrocarbons, GW RCLs based on Wisconsin Administrative Code, Chapter NR 720.09 generic Residual Contaminant Level for protection of groundwater.
5. DC RCLs for Non-Industrial Soil = Direct Contact Residual Contaminant Levels based on the following:
 For petroleum hydrocarbons, DC RCLs based on Wisconsin Administrative Code, Chapter NR 746.06 Table 1 ("Indicators of Residual Petroleum Product in Soil Pores") soil screening levels / Table 2 ("Protection of Human Health from Direct Contact with Contaminated Soil") concentrations.
 For PAHs, DC RCLs based on interim guidance RCL for protection of direct contact with PAH compounds for non-industrial land use, from WDNR publication RR-519-97 "Soil Cleanup Levels for Polycyclic Aromatic Hydrocarbons (PAHs) Interim Guidance" (April 1997), target risk of 1×10^{-6} used per NR 720.19(5)(a).
 For metals, DC RCLs based on Wisconsin Administrative Code, Chapter NR 720.11 generic Residual Contaminant Level for protection of direct contact for non-industrial land use
6. PRG for Residential Soil = US EPA Region IX Preliminary Remediation Goal for residential soil (October 2004) to use as a guideline to evaluate the direct contact exposure pathway
7. SSL = US EPA Region IX Soil Screening Level for protection of groundwater with a dilution-attenuation factor of 20 (October 2004) - provided as a guideline to evaluate soil
8. -- = PRG and SSL not provided for PAHs because complete list of WDNR interim guidance standards exists for the PAH compounds
9. NS = no standard established
10. Laboratory flags:
 J = Analyte detected between Limit of Detection and Limit of Quantitation
 box = Concentration exceeds GW RCL
 [brackets] = Concentration exceeds DC RCL for Non-Industrial Soil (note that soil is located within 4 feet of the ground surface)
 underline = Concentration exceeds DC RCL for Non-Industrial Soil (note that soil is located deeper than 4 feet of the ground surface)
11. Exceedances:
 * Exceedances for PRGs and SSLs are not identified in this table, as these values are intended only as a preliminary screening tool at this time.

ATTACHMENT A
Sigma's Standard Procedures

GEOPROBE SOIL SAMPLING METHODOLOGIES

Standard Geoprobe sampling techniques (ASTM Standard D-1586-87) were utilized. The soil sampler was driven a distance of 48 inches to obtain a 48-inch core sample. Soil samples were examined and classified on the basis of their color, texture and plasticity in accordance with the United Soil Classification System (USCS). Head space analysis was also performed on a portion of each sample by placing a portion of the sample into a sealed container, allowing the container to equilibrate to approximately 70°F and then screening the sample with a photoionization or flame ionization detector.

The sample interval collected from the bottom of the borehole or the groundwater interface zone was submitted for laboratory analysis to identify the maximum concentration of soil impacts.

Sigma standard protocol for decontamination was used on all drilling equipment. This included steam cleaning all down-hole equipment between borings.

Soil borings were abandoned with bentonite chips. Borehole Abandonment Forms (WDNR Forms 3300-5B) are included with the appendices.

All auger spoil was placed in 55-gallon Department of Transportation (DOT) steel drums, labeled, sealed, and temporarily stored on-site pending disposal arrangements.

SOIL SAMPLING METHODOLOGIES

Standard split-spoon sampling techniques (ASTM Standard D-1586-87) were utilized. The two-inch outside diameter split-spoon sampler was driven a distance of 24 inches below the lead auger by means of a 140 pound hammer free falling 30 inches. The standard penetration resistance (nominal value) was obtained by counting the number of hammer blows over the final 12 inches of sampler advancement. This value provides a quantitative, in-place relative density of cohesionless soils. The value is quantitative only, since many factors can significantly affect the standard penetration value. Direct correlation of the results obtained by the field personnel using different drill rigs, drilling procedures and hammer-rod-spoon assemblies should not be made.

Soil samples were examined and classified on the basis of their color, texture and plasticity in accordance with the United Soil Classification System (USCS).

The sample interval exhibiting the highest Photoionization Detector (PID) or Organic Vapor Monitor (OVM) value from each soil boring was submitted for laboratory analysis to identify the maximum concentration of soil impacts. In sample intervals exhibiting lower or non-detectable values, samples were submitted to delineate the vertical boundaries of impacted soils.

Sigma standard protocol for decontamination was used on all drilling equipment. This included steam cleaning all down-hole equipment between borings with special emphasis on split-spoon samplers. Between each boring, the split-spoon samplers were also sprayed with hexane and triple rinsed with deionized water. Between each sampling interval, the split-spoon samplers were washed in a hot Alconox soap solution and rinsed with clean tap water.

Soil borings not converted into monitoring wells were abandoned with bentonite chips. Borehole Abandonment Forms (WDNR Forms 3300-5B) are included with the appendices.

All auger spoil was placed in 55 gallon Department of Transportation (DOT) steel drums, labeled, sealed, and temporarily stored on-site pending disposal arrangements.

MONITORING WELL INSTALLATION METHODOLOGIES

Each of the monitoring wells were constructed of two-inch inside diameter Schedule 40 PVC casing, coupled to 10- or 15-foot sections of 0.010 inch factory slotted PVC well screen. Casing and screen were field assembled from hermetically sealed packages to ensure well integrity. The wells were installed with the screened interval intersecting the water table to determine groundwater quality and provide groundwater flow direction information.

The wells were completed in accordance with Wisconsin Administrative Code, Chapter NR 141 (NR 141) "Groundwater Monitoring Well Requirements." The wells were constructed with the 4½-inch I.D. hollow stem augers. The position of the filter pack, filter pack seal, annular space seal, and surface seal were confirmed by measuring with a weighted measuring tape. Monitoring Well Construction Diagrams (WDNR Form 4400-113A) were completed for each well.

Following the complete removal of the auger, a watertight locking flush-mount protective cover was cemented over the PVC well. In addition, an expandable watertight locking cap was placed inside the well casing and sealed. Flush-mount protective covers were used at the site due to the vehicular traffic across the site.

GROUNDWATER SAMPLING METHODOLOGIES

Each monitoring well was developed to remove fine sediment in the well and filter pack. Proper development minimized plugging of the well screen and ensured that groundwater entering the well was representative of on-site groundwater quality. The wells were developed in accordance with NR 141. Monitoring Well Development Forms (WDNR 4400-113B) and Sigma field sampling forms were completed for each well (see Appendices).

After well development, decontaminated Teflon bailers were used to purge three well volumes from each monitoring well. Development and purge water was containerized in DOT approved 55-gallon drums and transported off site for proper disposal.

Following the purging of the wells, groundwater samples were collected using a Teflon bailer. The groundwater samples were transferred from the bailer equipped with a bottom-emptying device into 40-milliliter glass vials. The vials were placed in a cooler with ice, accompanied with a Chain-of-Custody document and transported to a laboratory specified for analysis.

All equipment used during development, purging and sampling of the wells was decontaminated using the following procedure: double Alconox soap wash, triple tap water rinse, triple deionized water rinse. Additionally, new bailer rope was used for each monitoring well.

Trip and field blanks were included in the groundwater sampling program. The blanks are used as an indicator to determine if any contaminants have infiltrated the sample during transportation or during field procedures. Additionally, duplicate groundwater samples were collected to measure laboratory precision. The laboratory was not informed of the location/source of the duplicate samples.

Water used for pouring trip blanks and field blanks was obtained from the laboratory on the day of sampling. Trip blanks were poured from laboratory deionized water into 40-milliliter vials and kept with the sample containers in coolers during transportation. Field blank water was laboratory-grade deionized water collected such that no headspace remained. The water was poured through a decontaminated bailer into 40-milliliter vials at the last well of the day.

STATIC WATER METHODOLOGIES

Static water levels were measured to determine the direction and gradient of groundwater flow, and to monitor seasonal variations of the water table. The data was collected using an electronic water level indicator (WLI) or interface probe (IP). The WLI measures depth to water, while the IP measures depth to water and determines if free produce is present on the phreatic surface (water table). Proper decontamination procedures, previously described, were adhered to.

The monitoring well top of casing elevations were professionally surveyed to vertical accuracy of ± 0.01 feet, and a horizontal accuracy of 1.0 feet. Elevations were referenced to a USGS Datum Mean Sea Level (MSL). Depth to groundwater measurements were referenced to the surveyed well casing elevations to determine groundwater flow directions, gradients, and seasonal fluctuations.

Facility License, Permit or Monitoring Number _____ _____ _____ _____	County Code _____ _____ _____ _____	Wis. Unique Well Number _____ _____ DNR Well ID Number _____ _____

1. Can this well be purged dry?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	11. Depth to Water (from top of well casing)	Before Development <i>13.02 ft.</i>	After Development <i>22.97 ft.</i>
2. Well development method		Date	<i>b06/30/2008</i>	<i>m m d d y y y y</i>
surged with bailer and bailed	<input type="checkbox"/> 41	Time	<i>10:00</i>	<i>a.m.</i>
surged with bailer and pumped	<input type="checkbox"/> 61		<i>11:00</i>	<i>a.m.</i>
surged with block and bailed	<input type="checkbox"/> 42			
surged with block and pumped	<input type="checkbox"/> 62			
surged with block, bailed and pumped	<input type="checkbox"/> 70			
compressed air	<input type="checkbox"/> 20			
bailed only	<input type="checkbox"/> 10			
pumped only	<input checked="" type="checkbox"/> 51			
pumped slowly	<input type="checkbox"/> 50			
Other _____	<input type="checkbox"/> _____			
3. Time spent developing well	<i>60</i> min.	12. Sediment in well bottom	_____ inches	_____ inches
4. Depth of well (from top of well casing)	<i>24.75</i> ft.	13. Water clarity	Clear <input type="checkbox"/> 10	Clear <input type="checkbox"/> 20
5. Inside diameter of well	<i>1.0</i> in.		Turbid <input type="checkbox"/> 15	Turbid <input type="checkbox"/> 25
6. Volume of water in filter pack and well casing	_____ gal.	(Describe)	<i>Slight turbid</i>	<i>Slight turbid</i>
7. Volume of water removed from well	<i>3.0</i> gal.		_____	_____
8. Volume of water added (if any)	<i>None</i> gal.		_____	_____
9. Source of water added	<i>None</i>		_____	_____
10. Analysis performed on water added?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No (If yes, attach results)	14. Total suspended solids	_____ mg/l	_____ mg/l
17. Additional comments on development:	Fill in if drilling fluids were used and well is at solid waste facility: 15. COD _____ mg/l _____ mg/l			
	16. Well developed by: Name (first, last) and Firm First Name: <i>David</i> Last Name: <i>Dailey</i> Firm: <i>Sigma Env.</i>			

Name and Address of Facility Contact/Owner/Responsible Party
First Name: _____ Last Name: _____
Facility/Firm: _____
Street: _____
City/State/Zip: _____

I hereby certify that the above information is true and correct to the best of my knowledge.
Signature: *David Dailey*

Project Name BISHOPS CREEK
Project # 10909

Invoice # E17398

"J" Flag: Analyte detected between LOD and LOQ

LOD Limit of Detection

LOQ Limit of Quantitation

Code **Comment**

1 Laboratory QC within limits.

BLE denotes sub contract lab - Certification #445023150

ESC denotes sub contract lab - Certification #998093910

SUB denotes sub contract lab - Certification #999999999

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight.

Project Name REINHART BOERNER
Project # 10909

Invoice # E17441

"J" Flag: Analyte detected between LOD and LOQ

LOD Limit of Detection

LOQ Limit of Quantitation

Code **Comment**

1 Laboratory QC within limits.

5 The QC blank not within established limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight.

Authorized Signature

July 02, 2008

Client:	SIGMA ENVIRONMENTAL SERV. - Milwaukee 1300 West Canal Street Milwaukee, WI 53233	Work Order:	WRF1097
		Project Name:	Reinhart Boerner
		Project Number:	10909 Reinhart Boerner
Attn:	Mr. Steve Meer	Date Received:	06/30/08

An executed copy of the chain of custody is also included as an addendum to this report.

If you have any questions relating to this analytical report, please contact your Laboratory Project Manager at 1-800-833-7036

SAMPLE IDENTIFICATION	LAB NUMBER	COLLECTION DATE AND TIME
SMW-1	WRF1097-01	06/30/08 11:00
SMW-3	WRF1097-02	06/30/08 11:00

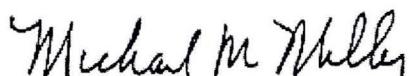

Samples were received without ice into laboratory at a temperature of 0 °C.

Wisconsin Certification Number: 128053530

The Chain of Custody, 1 page, is included and is an integral part of this report.

Unless subcontracted, volatiles analyses (including VOC, PVOC, GRO, BTEX, and TPH gasoline) performed by TestAmerica Watertown at 1101 Industrial Drive, Units 9&10. All other analyses performed at the address shown in the heading of this report.

CERTIFICATION SUMMARY

TestAmerica Watertown

Method	Matrix	Nelac	Wisconsin
CALC	Water - NonPotable		
SM 3500CrD	Water - NonPotable		X
SW 6010B	Water - NonPotable		X
SW 6020A	Water - NonPotable		

DATA QUALIFIERS AND DEFINITIONS

- J** Results reported between the Method Detection Limit (MDL) and Limit of Quantitation (LOQ) are less certain than results at or above the LOQ.
- M11** The MS and/or MSD were above the acceptance limits. See calibration verification (CCV)
