**ANNUAL LANDFILL MONITORING REPORT  
FORMER GORSKI LANDFILL, MOSINEE, WISCONSIN**

Dear Ms. Sykora:

This Annual Landfill Monitoring Report has been prepared by Ramboll US Corporation (Ramboll) on behalf of an ad hoc group of parties (the "Group") associated with the former Gorski Landfill located in Mosinee, Wisconsin (Figure 1). Contact information for the involved parties is provided in Attachment A. Pursuant to the Wisconsin Department of Natural Resources (WDNR) correspondence dated February 17, 2017, regarding the former Gorski Landfill site, Ramboll has prepared this letter to document the annual landfill cover inspection and groundwater monitoring event that was conducted in October 2019. The methodology and results of these October 2019 activities are provided as follows.

March 23, 2020

Ramboll  
175 North Corporate Drive  
Suite 160  
Brookfield, WI 53045

**LANDFILL COVER INSPECTION**

The annual landfill cover inspection was conducted by Ramboll on October 21, 2019, by traversing the entire site and observing the surface of the cover for evidence of erosion and exposed waste materials. The adequacy of the cover integrity was reviewed. Photographs were also taken as appropriate to document site conditions. No exposed waste materials and no erosion of the vegetated landfill cover was observed. Based on the results of the October 2019 landfill cover inspection, the condition of the landfill cover is concluded to be consistent with its designed intent and repairs to the landfill cover are not necessary at this time.

**MONITORING WELL SAMPLES**

Pursuant to the WDNR correspondence dated February 17, 2017, the following monitoring wells in the vicinity of the former landfill were sampled in October 2019 as part of the annual landfill monitoring event: MW-4, MW-6, PZ-3, and PZ-4 (Figure 2). The groundwater samples collected from these monitoring wells were submitted to Pace Analytical Services, Inc. (Pace) of Green Bay, Wisconsin, a Wisconsin-certified laboratory, and the laboratory reports are provided in Attachment B. The groundwater samples were analyzed for volatile organic compounds (VOCs) and the following field parameters: groundwater elevation, temperature, specific conductivity, pH, oxidation-reduction potential (ORP), and dissolved oxygen (DO).

The results of field parameter analyses are summarized in Table 1. As shown in Table 1, temperatures of the October 2019 groundwater samples ranged from 10.4

to 11.9 degrees Celsius (50.7 to 53.4 degrees Fahrenheit). The October 2019 groundwater samples revealed pH values that ranged from 4.87 to 5.68, and specific conductivity values ranged from 88 to 200 microsiemens ( $\mu\text{s}$ ).

DO concentrations ranged from 1.97 to 8.57 milligrams per liter (mg/L), and ORP values ranged from +130 to +203 millivolts (mV). The presence of DO concentrations greater than 0.5 mg/L and ORP values greater than -100 mV are consistent with historical values and represent conditions that are not highly favorable for naturally occurring reductive dechlorination of chlorinated VOCs through anaerobic biodegradation. However, some degree of reductive dechlorination may occur at DO concentrations as high as 5 mg/L and ORP values as high as +50 mV (United States Environmental Protection Agency [USEPA], 1998: "Technical Protocol for Evaluating Natural Attenuation of Chlorinated Solvents in Groundwater," EPA/600/R-98/128). Based on the detected DO and ORP values, the groundwater monitoring information lead to the conclusion that groundwater within the vicinity of the former Gorski Landfill is generally aerobic and not highly favourable for the occurrence of naturally occurring reductive dechlorination of more chlorinated VOCs such as tetrachloroethene (PCE) and trichloroethene (TCE). Lesser halogenated VOCs such as vinyl chloride (VC), however, can be biodegraded in an aerobic environment.

Previous Annual Groundwater Monitoring Reports have included evaluations of PCE, TCE, cis-1,2-dichloroethene (cDCE), and VC concentration trends for the monitoring wells by using the Mann-Kendall Statistical Test for Trends, as formerly recommended by the WDNR for evaluating natural attenuation processes. Per current WDNR guidance, the Mann-Whitney U Test should be conducted by assembling well data for the most recent eight consecutive quarterly or semi-annual sampling events for each contaminant that has exceeded the Wisconsin Administrative Code (WAC) NR 140 Enforcement Standard (ES) at one or more monitoring wells. Because the monitoring well sampling frequency was modified from semi-annual to annual in 2011, the October 2019 groundwater sampling event was not preceded by consecutive quarterly or semi-annual sampling events. Therefore, the results could not be analyzed using the Mann-Whitney U Test. As such, qualitative discussions of the October 2019 groundwater sampling results (Table 2, Figure 3, and Attachment B) are provided as follows:

- At deep monitoring well PZ-3, concentrations of TCE, cDCE, trans-1,2-dichloroethene (tDCE), and VC have been generally decreasing since 2009. The October 2019 groundwater sample contained 1.1 micrograms per liter ( $\mu\text{g}/\text{L}$ ) TCE, which is above the WAC NR 140 Preventive Action Limit (PAL) (0.5  $\mu\text{g}/\text{L}$ ) but less than the WAC NR 140 ES (5  $\mu\text{g}/\text{L}$ ). The October 2019 groundwater sample also contained 10.6  $\mu\text{g}/\text{L}$  cDCE, which is above the WAC NR 140 PAL (7  $\mu\text{g}/\text{L}$ ) but less than the WAC NR 140 ES (70  $\mu\text{g}/\text{L}$ ). The TCE concentration has not exceeded the WAC NR 140 ES (5  $\mu\text{g}/\text{L}$ ) since October 2013, and the cDCE concentration has not exceeded the WAC NR 140 ES (70  $\mu\text{g}/\text{L}$ ) since October 2014. The analyte tDCE was not detected based on the analytical results of the October 2019 sampling event and has historically only exceeded the WAC NR 140 ES (100  $\mu\text{g}/\text{L}$ ) on one occasion (April 2008). The tDCE concentration has not exceeded the WAC NR 140 PAL since January 2009. VC has not been detected since October 2014.
- At shallow monitoring well MW-4, historical TCE concentrations have ranged from <0.13 to 14.9  $\mu\text{g}/\text{L}$  and have remained less than 10  $\mu\text{g}/\text{L}$  since July 2008. The October 2019 groundwater sample contained 6.0  $\mu\text{g}/\text{L}$  of TCE, which is above the WAC NR 140 PAL (0.5  $\mu\text{g}/\text{L}$ ) and WAC NR 140 ES (5  $\mu\text{g}/\text{L}$ ). The October 2019 groundwater sample also contained 1.3  $\mu\text{g}/\text{L}$  cDCE, which is below the WAC NR 140 PAL (7  $\mu\text{g}/\text{L}$ ) and consistent with historical results has remained below the WAC NR 140 PAL.

- At shallow monitoring well MW-6, detected concentrations of TCE have been generally decreasing since 2009. The October 2019 groundwater sample contained an estimated TCE concentration of 0.95 µg/L, which is above the WAC NR 140 PAL (0.5 µg/L) but less than the WAC NR 140 ES (5 µg/L). The October 2019 sample contained cDCE at an estimated concentration of 0.30 µg/L, which is below the WAC NR 140 PAL (7 µg/L) and consistent with historical results has remained below the WAC NR 140 PAL (7 µg/L).
- At deep monitoring well PZ-4 adjacent to MW-6, concentrations of TCE have been generally decreasing since 2010. The October 2019 groundwater sample contained 5.4 µg/L TCE, which is slightly above the WAC NR 140 ES (5 µg/L) and below the historical TCE concentration range of 6.2 to 21.6 µg/L. The October 2019 sample contained 1.7 µg/L cDCE, which consistent with historical results has remained below the WAC NR 140 PAL (7 µg/L).

Based on the October 2019 groundwater monitoring results, slight exceedances of the WAC NR 140 ES for TCE were detected in groundwater samples from two monitoring wells (6.0 µg/L at MW-4 and 5.4 µg/L at PZ-4). No other exceedances of WAC NR 140 ES values were detected. The continued overall decreasing chlorinated VOC concentrations support the conclusion that the residual (low parts per billion) chlorinated VOCs in groundwater are naturally attenuating.

## **RESIDENTIAL WELL SAMPLES**

Pursuant to the WDNR correspondence dated February 17, 2017, the following residential wells were sampled in October 2019 as part of the annual landfill monitoring event: 626 CTHB, 642R CTH B, 652R CTH B, 666 CTH B, 669 CTH B, 670 CTHB, 1054 CTHKK, 1058 CTHKK, 1096 CTHKK, and 1101 CTHKK. The water samples obtained from the residential wells were submitted to the Wisconsin-certified laboratory and were analyzed for VOCs, the results of which are provided in Attachment B and summarized in Table 3.

As shown in Table 3, the residential well water duplicate sample from 669 CTH B was the only October 2019 sample that contained a detectable VOC concentration. TCE was detected at an estimated concentration of 0.33<sup>1</sup> µg/L, below the WAC Public Health NR 140 PAL (0.5 µg/L) and WAC Public Health NR 140 ES (5 µg/L). The estimated concentration is also below the Safe Drinking Water Act Maximum Contaminant Level (MCL) for TCE of 5 µg/L. The October 2019 sample result is consistent with previous TCE concentrations at this location, ranging from <0.26 to 3.15 µg/L, none of which have exceeded the UESPA established MCL for TCE.

## **SUMMARY OF SITE CONDITIONS**

### **On-Site Receptors**

Sediment quality was evaluated through the collection and laboratory analysis of sediment samples from surface waters immediately adjacent to the former landfill as part of the AECOM WAC NR 716 Site Investigation that was conducted in 2003. The occurrence of waste materials and possible leachate seeps at the landfill site were also evaluated at that time.

Field observations during the 2003 Site Investigation activities and a May 2006 site visit revealed the presence of several small isolated areas of exposed non-soil materials (mainly metallic debris) within the former Gorski Landfill footprint. During both the 2003 and 2006 site investigations, leachate seeps were not

---

<sup>1</sup> Estimated value between limit of detection and limit of quantification.

observed by AECOM such that no leachate samples were collected. Two sediment samples collected from areas of standing water within the former landfill limits in 2003 revealed detected concentrations of arsenic, barium, chromium, and lead that were within their respective observed ranges of naturally-occurring concentrations in soils. Detected concentrations of cadmium were substantially lower than the non-industrial land use WAC NR 720 direct contact Residual Contaminant Level (RCL). Moreover, the former Gorski Landfill was reportedly covered with 8 to 12 inches of decomposed granite after landfilling activities ceased in approximately 1976. In addition, waste mitigation activities were completed in June and July 2010. The presence of the 8 to 12-inch layer of decomposed granite followed by imported clean fill and vegetation in 2010 over the former landfill serves to restrict completion of the direct contact pathway.

Based on toxicity, concentration, and frequency of detection, the remaining constituents of interest in groundwater near the former Gorski site are TCE, and to a lesser degree cDCE. Historically, the most heavily impacted well was PZ-3, which is located on site. As shown in Table 2, TCE and cDCE concentrations in groundwater samples obtained from well PZ-3 have been decreasing since 2006. The detected TCE concentrations historically ranged as high as 356 µg/L in 2006 but declined to 1.1 µg/L in October 2019, which is less than its WAC NR 140 ES value of 5 µg/L. Based on the October 2019 groundwater monitoring results, no VOCs other than TCE and cDCE were detected at concentrations greater than WAC NR 140 PAL values at well PZ-3. It can therefore be concluded that the source of TCE in groundwater at the landfill has been substantially depleted, and the downgradient residual TCE concentrations (0.95 to 6.0 µg/L at wells MW-4, MW-6 and PZ-4 as shown on Figure 3) should continue to decline in response to the upgradient source depletion.

As shown on Figure 3, none of the October 2019 groundwater samples contained cDCE concentrations greater than the WAC NR 140 ES of 70 µg/L. The maximum cDCE concentration was detected in the groundwater sample from on-site well PZ-3, which contained 10.6 µg/L. None of the other monitoring wells within the site vicinity exceeded the WAC NR 140 PAL of 7 µg/L for cDCE. As with TCE, cDCE concentrations in groundwater samples obtained from well PZ-3 have substantially decreased since 2006 (from 4,300 µg/L in 2006 to 10.6 µg/L in October 2019). It can therefore be concluded that:

- reductive dechlorination of the depleted source of TCE in groundwater at the landfill (1.1 µg/L at PZ-3) has likely contributed to a residual on-site concentration of 10.6 µg/L of degradation product cDCE (well below the ES of 70 µg/L); and
- downgradient residual cDCE concentrations (0.3J to 1.7 µg/L at wells MW-4, MW-6 and PZ-4 as shown in Table 2), which are already less than the WAC NR 140 PAL of 7 µg/L, should continue to decline in response to the upgradient source depletion.

### Off-Site Receptors

Two replacement water-supply wells were installed in April 2007 in the northeast portion of the adjacent east property (St. Paul's Cemetery) to provide potable groundwater for the 642 and 652 CTH B residences. The existing water-supply wells on the 642 and 652 CTH B properties were abandoned in June 2007, and the properties were connected via water supply pipeline to the new off-site water-supply wells. The replacement private wells are identified as 642R and 652R CTH B on Figure 2. Since the replacement of these water-supply wells in April 2007, none of the water samples obtained from any of the residential wells identified in Table 3 have contained concentrations of any analyzed parameter greater than its respective USEPA Safe Drinking Water Act MCL.

The Mosinee Flowage, located approximately 2,000 feet to the east of the former Gorski Landfill site, represents a potential surface water receptor. Possible impact to the Mosinee Flowage was evaluated as part of the 2003 WAC NR 716 Site Investigation through the installation and sampling of monitoring wells MW-2, MW-3, MW-4, and PZ-2, and as part of the 2006 to 2008 Supplemental Site Investigation through the installation and sampling of monitoring wells MW-6 and PZ-4 (as well as monitoring of previously-installed monitoring wells MW-2, MW-3, MW-4, and PZ-2).

Remedial objectives for surface water in the downgradient Mosinee Flowage are contained in WAC NR 105.08 non-public water supply surface water quality human threshold criteria, and WAC NR 105.09 human cancer criteria. The probable site-specific remedial objectives are located under the surface water classification "Warm Water Forage, Limited Forage, and Warm Water Sport Fish Communities." Based on concentration, toxicity and frequency of detection, TCE was selected as the constituent of concern for the purpose of evaluating the extent of affected groundwater within the vicinity of the former Gorski Landfill. The applicable WAC NR 105 non-public water supply human cancer criterion for TCE is 539 µg/L. The greatest detected TCE concentration in a monitoring well near the Mosinee Flowage occurred at well PZ-4 in October 2010 (21.6 µg/L TCE). This maximum detected TCE concentration at PZ-4 is substantially lower than the WAC NR 105 surface water quality human cancer criterion for TCE. Moreover, the residual TCE concentrations at well PZ-4 have steadily declined from 21.6 µg/L in October 2010 to 5.4 µg/L in October 2019 (as shown in Table 2). Similar declines in TCE concentrations have been observed at the other two downgradient monitoring wells MW-4 (14.9 µg/L in 2008 to 6.0 µg/L in October 2019) and MW-6 (23.9 µg/L in 2006 to 0.95J µg/L in October 2019).

WDNR vapor intrusion guidance for chlorinated volatile organic compounds (CVOCs) indicates that the vapor intrusion pathway should be investigated if any of the following conditions are met:

- The building of interest is located over a CVOC source.
- The building is located within 100 feet of a VOC source that has the potential to enter preferential pathways that connect to the building.
- The building overlies a groundwater plume that exceeds WAC NR 140 ES concentrations.
- Groundwater with CVOC concentrations that exceed WAC NR 140 PAL values is entering the building or is in contact with the building foundation or sump.
- Vapors have the potential to enter preferential pathways that connect to the building.

As none of the conditions identified above have been met, Ramboll concludes that an investigation of the vapor intrusion pathway is not warranted near the site, based on the available groundwater quality data and WDNR guidance.

## **CONCLUSIONS AND RECOMMENDATIONS**

Based on the presence of the 8 to 12-inch layer of decomposed granite followed by imported clean fill and vegetation in 2010 over the former landfill, the slight exceedances of ES values for TCE detected in October 2019 groundwater samples from monitoring wells MW-4 and PZ-4, and the decreasing CVOC concentrations in the collected groundwater samples since 2006, Ramboll concludes that natural attenuation processes are occurring, and that regulatory case closure is appropriate for the former Gorski Landfill site. Based on the slight exceedances of ES values for TCE at wells MW-4 and PZ-4, the regulatory case closure would be subject to the provisions that: 1) the site would be included on the WDNR geographic information system

(GIS) Registry of Closed Remediation Sites; and 2) in the event of future site development, evaluation of the vapor intrusion pathway would be conducted in accordance with WAC NR 700. Ramboll respectfully requests WDNR concurrence that natural attenuation processes are occurring to the extent that regulatory case closure in accordance with WAC NR 726 can be requested for the former Gorski Landfill site, subject to the two provisions identified above. Upon receipt of regulatory case closure, existing monitoring wells MW-4, MW-6, PZ-3, and PZ-4 would be abandoned in accordance with WAC NR 141.

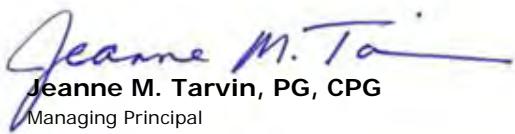

We trust that the information contained herein adequately meets your current needs. If you have any questions, please feel free to contact us. Thank you very much for your assistance with this matter.

Yours sincerely,

Notes:

PAL - Preventive Action Limit, Wisconsin Administrative Code NR 140.10 Table 1, January 2011, exceedances are *underlined italics*.

ES - Enforcement Standard, Wisconsin Administrative Code NR 140.10 Table 1, January 2011, exceedances are **bold**.

\*PAL or ES is for total trimethylbenzenes or total xylenes

J = Estimated value

#### Abbreviations:

1,1-DCE = 1,1-Dichloroethene

ug/L = micrograms per liter

cDCE = cis-1,2-Dichloroethene

mg/L = milligrams per liter

tDCE = trans-1,2-Dichloroethene

NA = Not Analyzed

TCE = Trichloroethene

ND or < = Analyte was not detected above laboratory method detection limit

VC = Vinyl Chloride

NE = Not Established

1,1,2-TCA = 1,1,2-Trichloroethane

1,1-DCA = 1,1-Dichloroethane

THF = Tetrahydrofuran

RE: Project: GORSKI LF 21-28201B  
Pace Project No.: 40197893

Dear Mark Mejac:

Enclosed are the analytical results for sample(s) received by the laboratory on October 24, 2019. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Steven Mleczko

## QUALIFIERS

Project: GORSKI LF 21-28201B  
Pace Project No.: 40197893

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor, percent moisture, initial weight and final volume.

LOQ - Limit of Quantitation adjusted for dilution factor, percent moisture, initial weight and final volume.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### LABORATORIES

PASI-G Pace Analytical Services - Green Bay
