Dear Mr. Gore and Ms. Anderson:

Re: Groundwater Monitoring Plan
Wausau Water Supply NPL Site

On behalf of the Wausau Water Supply PRP Group, CRA is submitting this FINAL Groundwater Monitoring Plan (Plan) for the Wausau Water Supply NPL Site. The agreed upon changes documented in our May 22, 2000, letter to you, responding to your comments on the draft Plan, have been incorporated into this final document as approved by your June 12, 2000, letter.

This Plan replaces the Monitoring Program Plan for future groundwater monitoring at the Site.

Sincerely,

CONESTOGA-ROVERS & ASSOCIATES

Jason Twaddle, PE

1.0 INTRODUCTION

Conestoga-Rovers & Associates (CRA) has prepared this Groundwater Monitoring Plan for the Wausau Water Supply NPL Site (Site) in Wausau, Wisconsin, on behalf of the Wausau Potential Responsible Party (PRP) Group. This Groundwater Monitoring Plan is a modification to the April 1994 Monitoring Program Plan for the Site. Groundwater monitoring at the Site has been conducted in accordance with the Monitoring Program Plan for the past six years. This plan takes into account the changes that have occurred during the past six years.

1.1 HISTORY

The Wausau PRP Group initiated remedial action at the Site in the early 1990's in accordance with the September 29, 1990, Record of Decision (ROD) and the Consent Decree (CD) entered with the court on January 24, 1991. The final remedial action at the Site consisted of two soil vapor extraction (SVE) systems to address the source areas and groundwater extraction and treatment utilizing existing municipal supply wells and an extraction well. Figure 1.1 provides the Site location and Figure 1.2 provides a Site plan.

SVE Systems were installed at Marathon Electric (West Bank) and Wausau Chemical (East Bank) in January 1994 to address the source areas. The SVE system at Marathon Electric operated until April 1996, when the West Bank source remediation was approved as complete. The SVE system at Wausau Chemical continues to operate, pending additional verification sampling to address two areas of concern. Off-gas treatment is provided by vapor phase carbon.

Groundwater remediation is provided through two existing municipal supply wells (CW3 and CW6) and one extraction well installed at Marathon Electric (EW1). Water from the municipal supply wells is treated by air strippers at the Wausau water treatment plant. Water from EW1 is also treated by air stripping (over rip rap on the river bank) before being discharged to the Wisconsin River.

The pumping rates for the three extraction wells were originally defined in the CD. In the Groundwater Flow Model report (CRA, May 1993), CRA established a range of pumping rates that would maintain capture of the groundwater plume. Then, in an August 4, 1995, letter, the United States Environmental Protection Agency (USEPA) approved the optimum pumping configuration range from that report for the three extraction wells. Those pumping rates are:

- CW3: 65 hours per week at 1,200 gallons per minute (gpm) to 100 hours per week at 1,100 gpm.
- CW6: 85 hours to 100 hours per week at 1,400 gpm.
- EW1: 800 to 900 gpm continuously.

The 1994 Monitoring Program Plan addressed SVE system monitoring through soil and soil gas sampling, and groundwater monitoring through water level measurements and water quality sampling. Because the SVE systems have been turned off or are near the end of their lives, this plan does not address SVE system monitoring. As long as the east bank SVE system continues to operate, it will continue to be monitored as specified in the Monitoring Program Plan, or as agreed to through independent arrangements.

The groundwater monitoring portion of the Monitoring Program Plan was a complex system of monthly, quarterly, semiannual, and annual monitoring. Extraction Well 1 (EW1) is sampled monthly for a Site list of volatile organic compounds (VOCs) and annually for a more comprehensive list of parameters. A comprehensive list of 44 monitoring wells are sampled annually, and water levels are measured semiannually. A core group of 12 wells are sampled quarterly for site specific parameters.

The Monitoring Program Plan requires the submission of Monthly Progress Reports. These reports contain the following information, as it is available and relevant: operational data for the SVE systems, operational information for the Operable Unit 1 extraction well (EW1), pumping data for the City wells, dates of sampling and monitoring events, and copies of laboratory/monitoring data.

1.2 OBJECTIVES

The purpose of this report is twofold. First, we studied the groundwater data that has been collected over the past six years to evaluate the progress of the groundwater remediation system. Using the information obtained from that evaluation, we developed a revised groundwater monitoring plan for future use. The revised monitoring plan is more appropriate to the current size of the groundwater contaminant plume and the rate of change that is occurring in the plume.

This Groundwater Monitoring Plan replaces the Monitoring Program Plan as part of the final remedy for monitoring the operation and performance of the groundwater remediation systems, as required by the CD. Within the purpose of the report, there are four objectives that apply to both the evaluation of the past data and the collection of future data. Those objectives are as follows:

- to monitor flow patterns at the Site, as modified by groundwater remediation operation and Wisconsin River fluctuation, by the measurement and assessment of groundwater levels;
- to monitor the horizontal and vertical hydraulic zone of capture, within the pumped aquifer, by measurement and assessment of groundwater levels;
- to monitor the long term improvement in groundwater quality at the Site by the collection and chemical analysis of groundwater samples from monitoring and extraction wells; and
- to monitor the treatment of extracted groundwater for VOC removal by the collection and chemical analysis of influent and effluent water samples from the treatment systems.

1.3 GROUNDWATER CLEANUP STANDARDS

The groundwater monitoring objectives were developed to meet certain cleanup standards for the groundwater at the Site. The groundwater cleanup standards for the Site are the USEPA maximum drinking water contaminant levels (MCLs). The MCLs replace the previous cleanup standards specified in the Consent Decree and the Monitoring Program Plan. This change was communicated by the USEPA in a letter dated June 28, 1999 (Appendix A). The MCLs for the primary VOC contaminants of concern at the Site are:

Trichloroethylene (TCE)	5 µg/L
Tetrachloroethylene (PCE)	5 µg/L
Cis-1,2-Dichloroethylene (DCE)	70 µg/L

1.4 SITE GEOLOGY

The Site is underlain by glacial outwash and alluvial sediments which have filled in the preglacial stream valley in which the Wisconsin River now follows. This alluvial aquifer ranges from 0 to 160 feet thick and has an irregular base and lateral boundaries. The boundaries of the aquifer are defined by the relatively impermeable bedrock which underlie it and form its lateral boundaries within a preglacial valley. Six production wells in the Site area provide drinking water for the City of Wausau. These wells are screened in the glacial outwash and alluvial sand and gravel deposits which underlie and are adjacent to the Wisconsin River.

1.5 BACKGROUND

Groundwater monitoring at this Site is a combination of hydraulic and water quality monitoring designed to verify that the groundwater extraction wells are containing the contaminant plume and that groundwater quality is improving because of source remediation and VOC removal from the aquifer.

Groundwater remediation, at a site like Wausau, is a long-term process that cannot be readily measured on a short-term basis using water quality data alone. Because of the time necessary to achieve various levels of groundwater remediation, containment of contaminated groundwater is the primary measurable and achievable short-term objective.

Actual remediation of the groundwater is a slower process that is much more difficult to measure using field data on a short-term basis. Accordingly, water quality data is measured periodically on a long-term basis to show the downward trend of VOC concentrations in groundwater. Significant VOC reductions are measured over a period of years rather than weeks or months.

For the purpose of evaluation, groundwater monitoring at Wausau has been divided into two areas; the east bank and the west bank of the Wisconsin River. The river forms a natural hydraulic division of the Site. There are three active groundwater extraction wells designed to contain and remove VOC contaminated groundwater. Two of the extraction wells are on the west bank, CW6 and EW1, and one is on the east bank, CW3 (Figure 1.2).

In Section 2.0 of this report, we present the groundwater monitoring data collected for the Monitoring Program Plan. The data is evaluated to show how the objectives of the monitoring program have been met. This information is then used in Section 3.0 to develop a more efficient groundwater monitoring plan that is appropriate to the current conditions at the Site.

2.0 HISTORIC MONITORING

2.1 WATER LEVEL MONITORING

As specified by the Monitoring Program Plan, Site groundwater elevations have been measured at a comprehensive set of wells twice annually. The data for all of these groundwater elevation monitoring rounds is presented in Appendix B. The water table elevations for the two 1999 water level monitoring rounds (April and October) are also presented on Table 2.1. These two sets of data were evaluated to determine the flow patterns of the Site groundwater.

The groundwater contours for April and October 1999 are presented on Figures 2.1 and 2.2. As illustrated on these figures, groundwater flow within the unconfined glacial aquifer is controlled by the operation of EW1 and the City production wells. Under natural conditions, groundwater would flow toward and discharge to the Wisconsin River and its tributary, Bos Creek. Under existing conditions, however, groundwater flows toward EW1 and the production wells. The operation of EW1 has created groundwater flow divides between the west and east City well fields and has isolated the former landfill source of contaminated groundwater from the production wells.

2.2 GROUNDWATER SAMPLING

The groundwater monitoring network in the Monitoring Program Plan was designed to measure long-term water quality improvement through the collection and chemical analysis of groundwater samples from a comprehensive group of wells on an annual basis. In order to verify that significant changes were not occurring over the short-term, a group of core wells were monitored quarterly.

The analyte list for the monitoring well samples has consisted of a complex combination of parameters and wells intended to not only monitor the progress of the VOC remediation, but also to monitor for potential new contaminants that may have leached into the Site groundwater. The original combination of analytes and wells was renegotiated with USEPA and the Wisconsin Department of Natural Resources (WDNR) after the first annual round of samples was collected in December 1993. Groundwater samples have been analyzed for the parameters indicated below since that time:

- Comprehensive group of wells, sampled annually for:
 - Site specific analyte list (Table 2.2)

- Indicator wells (subset of the comprehensive group), sampled annually for:
 - Target Compound List VOCs
 - Target Compound List Semivolatiles
 - Target Analyte List Metals
- Core group of wells, sampled quarterly for:
 - Site specific VOCs (Table 2.2)

Appendix C contains tables of analytical results for all of the monitoring well samples collected beginning in December 1993. The VOC data is presented first, followed by the semivolatile data, then the metals data.

2.3 EXTRACTION WELL (EW1) SAMPLING

The monitoring program for EW1 was designed to measure long-term water quality improvement in the groundwater and to measure the treatment of the groundwater extracted by EW1. This data is also used to measure the contaminant levels discharged to the Wisconsin River from the EW1 treatment system. The discharge should meet the substance of the requirements of the Wisconsin Pollutant Discharge Elimination System (WPDES).

Influent and effluent samples have been collected from EW1 monthly and analyzed for the Site specific VOCs (Table 2.2). The monthly effluent sample is also analyzed for the Site specific metals. In addition, an effluent sample is analyzed annually for Target Compound List volatiles and semivolatiles and Target Analyte List metals. The longer list of analytes in the annual sample was intended to monitor for additional parameters that potentially could show up in the groundwater.

Appendix D contains tables of the analytical results of samples collected from the EW1 influent and effluent since December 1993. The VOC data is presented first, followed by the semivolatile data, then the metals data.

2.4 EVALUATION/CONCLUSIONS

As stated in Section 1.2, the objectives of groundwater monitoring at the Wausau Site are to monitor the containment of the contaminant plume and the long term improvement in groundwater quality.

To evaluate the improvement in groundwater quality, we added the quantities of chlorinated VOCs (CVOC) in each monitoring well, for each of the seven annual sampling events (December 1993 through October 1999). This data is presented on Table 2.3. The data is also plotted and contoured on Figures 2.3 through 2.9, one figure per sampling event.

The figures clearly show an overall reduction in the CVOC plume at the Wausau Site. The size of the plume has been shrinking, and in general, the concentrations have been decreasing.

West Bank

The decrease has been most dramatic on the west bank. The total CVOC concentration in monitoring well R2D on the west bank has decreased from 3635 µg/L in 1993, to 110 µg/L in 1999. While there has been a significant increase in the total CVOC concentration at monitoring well R3D just to the south of R2D, this may be due to a slug of contaminants slowly moving towards extraction well EW1. As shown on Figures 2.1 and 2.2, R2D is near the flow divide between the capture zones of both EW1 and CW6; therefore, groundwater flow would be very slow or sometimes stagnant, in this region. However, it appears that the last slug of highly concentrated CVOCs on the west bank is now flowing towards EW1.

The 100 µg/L contour has been completely absent north of R2D (towards production well CW6) since 1996, indicating that CW6 has been successful at capturing the contaminant plume. Total CVOC concentration at R4D, just north of EW1, has also decreased significantly from 1016 µg/L in 1993, to 33 µg/L in 1999. And the CVOC concentrations in the vicinity of EW1 have generally decreased, indicating that EW1 has been successful at capturing the contaminant plume.

On the west bank, the CVOC plume is found primarily in the deeper monitoring wells (greater than 75 feet). The exception to this is at the southern end of the plume, by the old landfill and Marathon Electric, the original source areas. In this area, moderate and low level CVOC concentrations are found in both the shallow and deeper wells. However, to the north of Marathon Electric, CVOCs are only found in the deeper wells. This may be because the CVOCs, which are heavier than water, first descended in the aquifer and then were pulled north by the City's production well field. The production wells are screened in the deeper portion of the aquifer and, therefore, draw water primarily from the deeper portion of the aquifer. Installation of EW1 has drawn some of the CVOCs back to the south, where they have been captured by EW1.

The primary CVOC found on the west bank is trichloroethene. Tetrachloroethene was only detected in a few samples, at low concentrations. The degradation product cis-1,2-dichloroethene was detected in the monitoring wells with the highest concentrations of trichloroethene at approximately 1%-2% of the trichloroethene concentration. The cis-1,2-dichloroethene concentrations decreased as the trichloroethene concentration decreased. Vinyl chloride was only detected in one well on the west bank (C4S), and vinyl chloride was the only CVOC detected in that well.

East Bank

The reductions on the east bank are not as dramatic or as obvious. While the size of the plume has decreased slightly, the total CVOC concentrations have decreased and increased since 1993. From 1993 to 1996 there is a definite decrease in the overall plume size and concentration, as the 100 µg/L contour disappears completely and the 10 µg/L contour decreases in size. While the overall plume size then remains relatively constant between 1996 and 1999, slugs of CVOC greater than 100 µg/L appear in different locations in 1997, 1998, and 1999.

On the east bank, the CVOC plume is found primarily in shallower monitoring wells (less than 75 feet). Operation of the groundwater extraction system at Wausau Chemical between 1985 and 1996 may have limited the downward migration of CVOCs. The extraction system at Wausau Chemical consisted of a series of shallow wells at the south end of the Wausau Chemical property. When this system ceased operation in 1996, contaminants that previously were captured by this system now flow towards CW3, which may be the cause of the slugs that have appeared in the plume since 1996. Those slugs are captured by CW3, however.

Tetrachloroethene and trichloroethene are the primary contaminants on the east bank, with tetrachloroethene generally at much higher concentrations. However, both of the degradation products cis-1,2-dichloroethene and vinyl chloride are also detected throughout the monitoring period, indicating that natural attenuation of the plume is occurring on the east bank. In general, concentrations of tetrachloroethene and trichloroethene decreased between 1993 and 1999, while concentrations of cis-1,2-dichloroethene and vinyl chloride increased. In fact, the slugs of high concentration CVOCs that reappeared since 1996 are primarily composed of cis-1,2-dichloroethene and vinyl chloride.

Hydraulic Capture

Horizontal and vertical capture of the contaminant plume is demonstrated on Figures 2.1 and 2.2. The water table contours indicate that groundwater flow in the contaminated portions of the Site is toward the three extraction wells - CW3, CW6, and EW1. At nested well locations, the water table elevations for shallow and deep wells are similar, indicating horizontal flow and hydraulic containment of the shallow and deeper portions of the aquifer.

Other Parameters

On Table 2.3, nonchlorinated VOCs are also totaled. The nonchlorinated VOCs detected were benzene, toluene, ethylbenzene, and xylene (BTEX). However, BTEX was only detected consistently at one shallow monitoring well, FVD5, on the east bank. Concentrations of BTEX at FVD5 ranged from 773 µg/L to 2150 µg/L. The BTEX contamination appears to be isolated to the area around FVD5, and appears to be unrelated to the CVOC contamination typical of the Wausau Site.

Review of the semivolatile analytical data shows that only three analytes, the three on the Site specific list (2-methylnaphthalene, bis(2-ethylhexyl)phthalate, and naphthalene), have been detected since 1993. These have only been detected above the quantitation limit in three monitoring wells since 1995, C4S, FVD5, and GM1S, one detection in each well.

A review of the metals data for the monitoring wells also shows insignificant impact. The metals analytical data was compared to the Maximum Contaminant Levels (MCLs), (including the secondary MCLs, where applicable). Of the filtered samples collected, only the secondary MCLs for iron, manganese, and zinc were exceeded. (Filtered and nonfiltered samples were analyzed for metals and compared in December 1993. Only filtered samples have been collected since then).

EW1

The CVOC concentration at extraction well EW1, not surprisingly, have also decreased significantly since 1993. From a concentration of 86 µg/L in December 1993 to 21 µg/L in October 1999. The concentration in the effluent from the treatment system have also decreased from 59 µg/L in 1993 to 11 µg/L in 1999. Currently, the EW1 treatment system removes approximately 50% of the CVOCs in the extracted groundwater.

The analytical results of the semivolatile and metals data for the EW1 treatment system effluent were similar to the monitoring wells sample results. Bis(2-ethylhexyl)phthalate was the only semivolatile detected and in only one sample (1997). Of the metals, iron and manganese exceeded the secondary MCLs. No other MCLs were exceeded.

The results of the effluent samples were also compared to surface water discharge limits for discharge to the Wisconsin River as calculated by the WDNR when EW1 was proposed. Those discharge limits were presented in the Remedial Action Plan, Groundwater Extraction, Treatment, and Discharge System, Marathon Electric Manufacturing Co., Wausau, Wisconsin, and are also presented on Table 2.4.

The only analyte to exceed the discharge limits on Table 2.4 was zinc. As shown in Appendix D, Table D-3, zinc exceeded the discharge limit four times over the course of six years of monthly samples (approximately 70 samples). The concentration in the remaining samples were very low and did not approach the discharge limit. It appears the four exceedences were anomalies.

3.0 REVISED MONITORING PLAN

Groundwater monitoring conducted over the past six years, as specified in the Monitoring Program Plan, was designed to monitor final remedial action implementation. The plan was developed as the remedial action was being designed and implementation began.

Since that time, the SVE portion of the remedial action has been nearly completed and the groundwater extraction portion of the remedial action has proven effective at containing and reducing contaminants in the groundwater. As discussed in Section 2.0, the CVOC plume is slowly shrinking and the concentrations are decreasing. Therefore, we are proposing a reduction in the frequency and quantity of groundwater monitoring.

3.1 WATER LEVEL MONITORING

Water level measurements will continue to be used to assess the hydraulic flow patterns at the Site and the capture of the CVOC plume. The Site is naturally divided into two hydraulic zones by the Wisconsin River. The east bank and west bank of the river were evaluated separately to select wells for water level monitoring.

The wells selected for water level monitoring are listed in Table 3.1 and shown on Figure 3.1. In addition, two or three staff gauges will be added to the Wisconsin River at locations along the length of the Site. Water levels will be measured in these wells and staff gauges annually in October. Water levels will be measured according to the procedures in Appendix E. The data will be used to prepare hydraulic contour maps of the Site to monitor the capture zones of the city production wells and the extraction well.

3.2 GROUNDWATER QUALITY MONITORING

Groundwater quality sampling is conducted to monitor the long-term improvement in the groundwater quality. In selecting which wells to sample for water quality parameters, the current status of the plumes on the west bank and the east bank were examined, as well as the rate of change that has occurred in those plumes. The east bank plume is controlled by pumping at CW3 and the west bank plume is controlled by pumping at CW6 and EW1.

The wells selected for water quality sampling are listed in Table 3.1 and shown on Figure 3.2. Samples will be collected from these wells annually in October. The data

will be used to prepare CVOC plume drawings to monitor the progress of groundwater remediation.

Samples will be analyzed for the Site Specific VOC List presented in Table 3.2. Samples will be shipped to Severen Trent Laboratories (STL) in North Canton, Ohio, for analysis by USEPA Method 8260. Samples from two wells, C4S and W53A, will also be analyzed for the semivolatile bis (2-ethylhexyl) phthalate by USEPA Method 8270.

The Quality Assurance Project Plan (QAPP), February 1994, as amended by a June 11, 1999, letter to the USEPA will be followed for sample collection and analysis. Groundwater sampling procedures are specified in Appendix E.

3.3 EXTRACTION WELL (EW1) MONITORING

Sampling of the EW1 extraction well treatment system is conducted to monitor the treatment of extracted groundwater, and the quality of water discharged to the Wisconsin River. Samples of the influent and effluent will be collected quarterly in January, April, July, and October. Samples will be shipped to STL for Site specific VOC (Table 3.2) analysis by USEPA Method 8260. The QAPP, as amended by a June 11, 1999, letter, will be followed for sample collection and analysis. Samples will be collected according to the procedures in Appendix E.

3.4 MONITORING PLAN MODIFICATIONS

The current groundwater quality sampling list has approximately two-thirds the number of wells previously sampled. Many wells have been removed from the sampling plan because of the decrease and stability of the plume. Two wells were added to the sampling schedule to help define the plume. Two or three staff gauges will also be added on the river to aid in defining the water table elevation.

West Bank

On the west bank, several shallow wells on the north half of the plume have been removed from the sampling schedule because, as explained in Section 2.4, the plume is limited to the deeper portion of the aquifer in this area. The wells that were removed are R3S, R2S, W56A, W55A, GM1S, MW7, and MW4B. All of these wells are less than 45 feet deep, except for MW4B, which is 60 feet deep. CVOC concentrations have been nondetect in these wells for all seven annual sampling rounds with only two exceptions.

The wells remaining on the sampling schedule in the northern end of the west bank plume are screened in the deeper portion of the aquifer. In addition, MW1A, which is screened in the deeper portion of the aquifer, was added to the sampling schedule to aid in defining the plume in this area.

Also on the west bank, two wells screened in the deeper portion of the aquifer in the vicinity of the old landfill limits have been removed from the sampling schedule. CVOC concentrations in C4D were nondetect in six annual sampling rounds and 1.3 µg/L in 1994. CVOC concentrations in W53 were nondetect from 1995 through 1998 and were below 3 µg/L the other three years.

Six wells have been dropped from the water level monitoring schedule on the west bank. All six are shallow wells, primarily in the north portion of the west bank plume. The remaining wells sufficiently monitor the hydraulics. The six wells that were removed from the water level monitoring schedule are: R1S, GM1S, W56A, MW3B, MW4C, and GM4S.

East Bank

On the east bank, five wells have been removed from the sampling schedule, in addition to the five wells from the original sampling schedule that have been abandoned in recent years (WW5, E30, TCT44, WC6, and WC6A). One well has been added to the sampling schedule.

As explained in Section 2.4, the east bank plume is primarily in the shallower portion of the aquifer; therefore, some of the wells screened in the deeper portion of the aquifer have been removed from the sampling schedule (E21, GM6D, and WC5). CVOC concentrations in E21 have been nondetect in the annual sampling rounds since 1995, and were below 1 µg/L before that. CVOC concentrations in GM6D were nondetect from 1996 through 1998 and were 2 µg/L in 1999. CVOC concentrations in WC5 were 1 µg/L in 1993 and have been nondetect since then.

Also, WC4 and WC4A have been removed from the sampling schedule. Only one detection of CVOCs (1µg/L) has been reported in these two wells in seven annual sampling rounds. Because of the pumping at CW3, groundwater is drawn from the river. Therefore, groundwater flowing past these two wells is primarily clean water from the river.

Most of the wells remaining on the sampling schedule for the east bank plume are screened in the shallower portion of the aquifer. WW6, which is also screened in the shallower portion of the aquifer, has been added to the sampling schedule to aid in defining the east bank plume.

Besides the five wells that have been abandoned, four wells have been removed from the water level monitoring schedule for the east bank. All four wells (IWS, IWM, WC7A and E21A) are shallow wells along the river. Staff gauges along the river will replace these for water table measurements.

Chemical Analysis

This revised groundwater monitoring plan primarily includes chemical analysis for the site specific VOCs listed on Table 3.2. Analysis for semivolatiles and metals has been discontinued, with the exception of samples from monitoring wells C4S and W53A, which will be analyzed for the semivolatile bis (2-ethylhexyl) phthalate. The intent of sampling the groundwater for these additional analytes was to monitor for new contaminants of concern. Monitoring over the past seven years has not resulted in any new contaminants of concern. The frequency and magnitude of semivolatile detections has decreased the past six years. Analysis for metals only shows exceedences of the secondary MCLs for iron, manganese, and zinc.

EW1

This revised sampling plan is a reduction from monthly to quarterly sampling and elimination of semivolatile and metals analysis. The reduction in frequency is justified by the steady decrease in the CVOC concentrations in both the influent and the effluent. The justification for elimination of semivolatile and metals analysis at EW1 is the same as the justification for eliminating these analytes at the monitoring wells; significant detections of none of these parameters has occurred during the past six years.

3.5 WELLS TO BE ABANDONED

There are several wells that have been part of the monitoring program for the past six years that are not included in the monitoring program described in Sections 3.1 and 3.2 of this Plan. The rational for not continuing to monitor these wells is given in Section 3.4. All of these monitoring wells will be abandoned according to the Wisconsin Well code. Table 3.3 presents a list of the wells that will be abandoned.

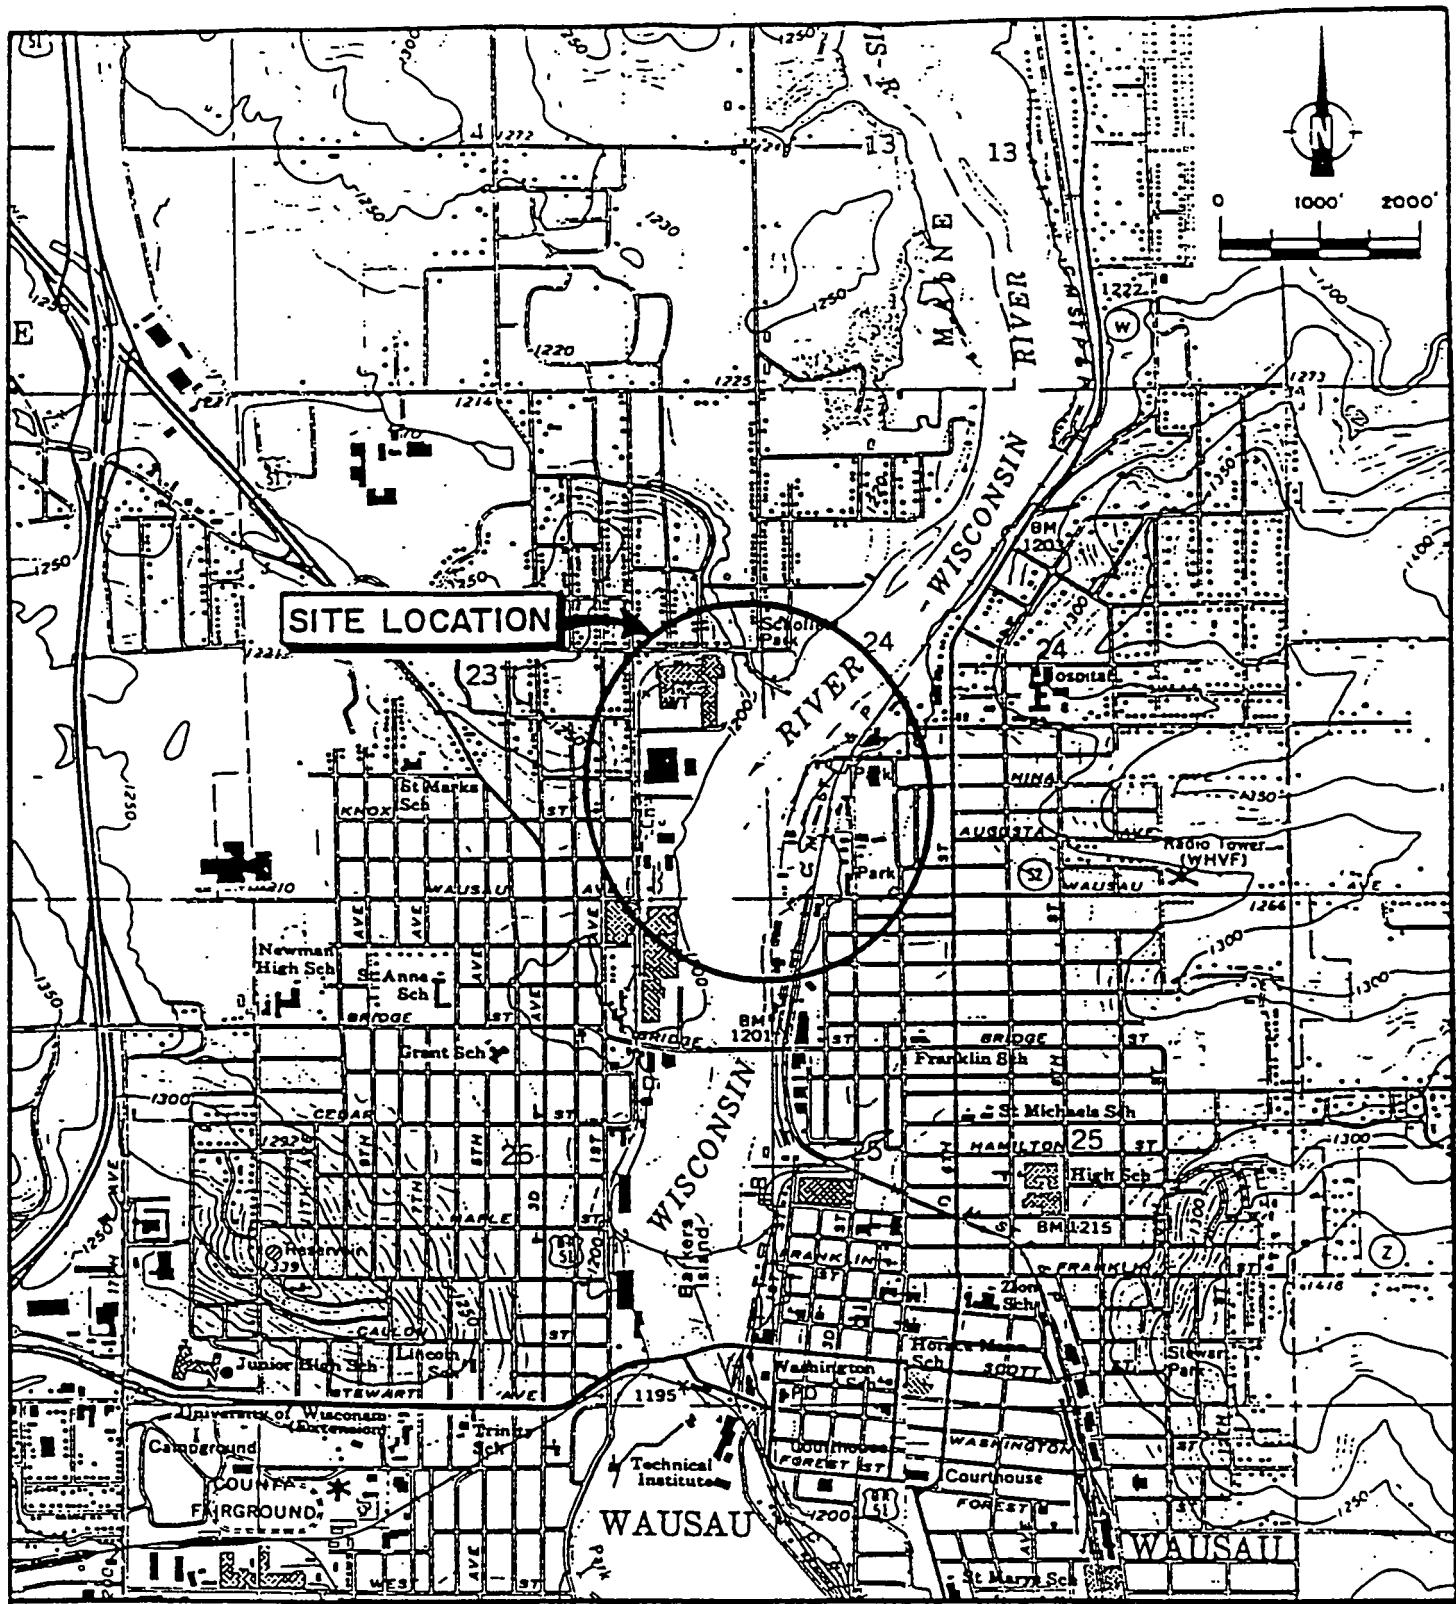

4.0 REPORTING

The results of each year's groundwater and treatment system monitoring will be reported in an annual report. The annual report will replace the monthly progress reports, and will include operational data, as well as monitoring data. The annual report will combine the information that is currently reported in the monthly progress reports with the information that is reported in Section 2.0 of this report.

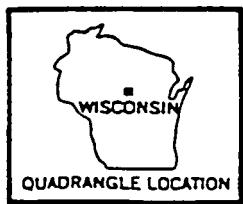

The annual report will cover one calendar year and will be submitted to the USEPA and WDNR in February of each year. A summary of the information that will be included in the annual report follows:

- Water level measurement data;
- Analytical chemical data;
- Groundwater contour and chemical plume figures;
- Treatment system monitoring results;
- Treatment system operational data;
- A summary of changes made to the treatment systems;
- A summary of any treatment system operational problems; and
- Recommended changes to the monitoring plan.

Results of the EW1 sampling events will be reported quarterly to USEPA and WDNR. The reports will include the volume of water pumped, pumping rate, sampling date, chemical results, and comparison of the results to appropriate discharge limits.

APPENDIX A

**GROUNDWATER CLEANUP STANDARDS
LETTER FROM USEPA**

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 5
77 WEST JACKSON BOULEVARD
CHICAGO, IL 60604-3590

3978

REPLY TO THE ATTENTION OF:

RECEIVED

JUL 06 1999

CRA, INC.

June 28, 1999

Jason Twaddle
Conestoga-Rovers
1801 Old Highway 8, Suite 114
St. Paul, Minnesota 55112

Dear Mr. Twaddle:

I am writing you regarding an update of the groundwater clean-up standards for trichloroethylene (TCE) and tetrachloroethylene (PCE), as listed on page 2 of the April 1994 Monitoring Program Plan for the Wausau Water Supply National Priorities List (NPL) Site in Wausau, Wisconsin.

As discussed at our June 24, 1999 Site meeting, the U.S. Environmental Protection Agency (USEPA) maximum drinking water contaminant levels (MCLs) will now apply as groundwater clean-up standards for the Wausau Superfund Site. The USEPA MCLs for both TCE and PCE are 5 micrograms per liter (ppb).

Please call me at 312-886-6552 or Wendy Anderson of the Wisconsin Department of Natural Resources (WDNR) at 715-839-1604 if you have any questions regarding this matter.

Sincerely,

A handwritten signature in black ink, appearing to read "Jeff Gore".

Jeff Gore, RPM

cc: Wendy Anderson, WDNR

Notes:

D - Field Duplicate Sample

J - The associated value is an estimated quantity for detected analytes.

U - The analyte was analyzed for, but was not detected above the quantitation limit.

UJ - The analyte was analyzed for, but not detected. The associated value is an estimated detection limit.

R - The data are rejected as unusable.

Notes:

D - Field Duplicate Sample

J - The associated value is an estimated quantity for detected analytes.

U - The analyte was analyzed for, but was not detected above the quantitation limit.

UJ - The analyte was analyzed for, but not detected. The associated value is an estimated detection limit.

R - The data are rejected as unusable.

Notes:

D - Field Duplicate Sample

N - Metals sample was not filtered.

J - The associated value is an estimated quantity for detected analytes.

U - The analyte was analyzed for, but was not detected above the quantitation limit.

UJ - The analyte was analyzed for, but not detected. The associated value is an estimated detection limit.

Notes:

D - Field Duplicate Sample

J - The associated value is an estimated quantity for detected analytes.

U - The analyte was analyzed for, but was not detected above the quantitation limit.

UJ - The analyte was analyzed for, but not detected. The associated value is an estimated detection limit.

R - The data are rejected as unusable.

UJ - The analyte was analyzed for, but not detected. The associated value is an estimated detection limit.

APPENDIX E

MONITORING PROCEDURES

APPENDIX E

MONITORING PROCEDURES

The water level monitoring and groundwater sampling field procedures will be conducted according to the following procedures.

WATER LEVEL MONITORING PROCEDURES

Groundwater elevations will be measured before purging for sample collection. All water levels in monitoring wells will be measured to the nearest 0.01 foot using the following procedure with an electric measuring tape:

1. Lower the tip into the well until contact with the water is indicated by the light and buzzer.
2. Raise the tip until the light and buzzer cease. Slowly repeat the lowering and raising to obtain a consistent reading (to the nearest hundredth of a foot) at the reference point.
3. Record the water level measurement in the field book or water level form. Compare to previous measurements to see if significant changes [i.e., greater than 2 feet] have occurred. Recheck water level if a significant difference is measured.
4. Decontaminate the bottom three feet of the measuring tape by rinsing with distilled water prior to using in each well.

Water levels in the extraction well (EW-1) will be recorded from a continuous monitoring instrument located at its well head. Water levels in the Wisconsin River will also be recorded. Water levels are taken at least weekly from City production wells. Data from these wells will be incorporated during monitoring events.

GROUNDWATER SAMPLING PROCEDURE

The following describes the key activities involved in groundwater sample collection:

a) Order of Sample Collection

Samples will generally be collected and containerized in the order of the following volatilization sensitivity:

- volatile organic compounds (VOCs);
- semi-volatile organic compounds (SVOCs);
- metals;
- pesticides/PCBs; and
- cyanide.

b) Sample Labels/Sample Identification

All samples must be labeled with:

- a unique sample number;
- date and time;
- parameters to be analyzed;
- job number; and
- sampler's initials.

Labels will be secured to the bottle and will be written in indelible inks.

c) Monitoring Well Purging

Prior to sampling, each monitoring well will be purged to remove three times the standing water volume in the well. Purging methods include submersible pump (adjustable rate), bladder pump, and bailer. A description of each of these methods follows.

Submersible Pumps

Submersible pumps provide high discharge rates for wells requiring large withdrawal volumes. Adjustable rate submersible pumps can be pumped at higher rates during purging and at low-flow rates for sample collection.

Bladder Pumps

Many of the Site monitoring wells contain dedicated bladder pumps, including teflon air and discharge tubing. Both well purging and sampling can be performed with bladder pumps.

Bailers

Teflon or stainless steel bailers are used on many of the shallower monitoring wells. Rope used for suspending the bailers must be kept off the ground and free of other contaminating material that could be carried into the well. Once used, the rope is discarded.

d) Monitoring Well Sample Collection

The following procedure will be used for sample collection at each monitoring well:

1. New disposable latex or nitrile gloves will be used when sampling each well. Additional glove changes will be made for each sampling.
2. The sampler will measure and record the depth to water in each well to the nearest 0.01 foot using an electric tape (as specified in an earlier section).
3. Before sampling, each well will be purged, using a teflon/stainless steel bladder pump, adjustable rate submersible pump, or bailer. Three times the standing water volume in the well will be removed. Field measurements of conductivity, temperature, and pH will be collected after purging and before sample collection. Calibration of field instruments will be conducted as specified in the QAPP. In the event that a well is purged dry before achieving three well volumes, groundwater will be permitted to recover to a level sufficient for sample collection. The time that the well was purged dry will be noted and well recovery will be monitored. Upon recovery, the sample will be collected from the well.

All purged groundwater, not used for samples, will be collected and discharged to the sanitary sewer or the extraction well (EW1) treatment manhole.

4. Containers for sample collection will be prepared in accordance with the QAPP. QA/QC samples (blind field duplicate, matrix spike and matrix spike duplicate, rinsate blank, and VOC trip blanks) will be collected or prepared as specified in the QAPP.
5. All disposable gloves and nylon ropes will be placed in the Marathon Electric disposal at a designated area. All equipment rinsings will be handled as discussed in item (3), above.
6. Samples will be placed in laboratory supplied coolers, with ice, immediately following collection and labeling.

e) Extraction/City Well Sampling

Influent samples from the City wells and extraction well (EW-1) will be collected according to the following procedure:

1. New disposable latex or nitrile gloves will be used when collecting the water samples.
2. The samples will be collected by the grab sample method directly into the precleaned sample containers. The samples will be collected at the well head directly from sampling ports.
3. Containers for sample collection will be prepared in accordance with the QAPP. QA/QC samples (blind field duplicate, matrix spike and matrix spike duplicate, rinsate blank, and VOC trip blanks) will be collected or prepared as specified in the QAPP.
4. Samples will be placed in laboratory supplied coolers, with ice, immediately following collection and labeling.

f) Treated Groundwater Effluent Sampling

The treated groundwater (effluent) samples will be collected according to the following procedure:

1. New disposable latex or nitrile gloves will be used when collecting the sample.
2. The samples will be collected by the grab sample method directly into the precleaned sample containers. The Marathon Electric effluent sample will be collected from the riprap-lined discharge structure immediately prior to the point where the treated groundwater enters the Wisconsin River. The City of Wausau sample will be collected from the air stripping towers effluent.

3. Containers for sample collection will be prepared in accordance with the QAPP. QA/QC samples (blind field duplicate, matrix spike and matrix spike duplicate, and VOC trip blanks) will be collected or prepared as specified in the QAPP.
4. Samples will be placed in laboratory supplied coolers, with ice, immediately following collection and labeling.

EQUIPMENT CLEANING PROCEDURE

Submersible pumps and bailers will be decontaminated between each well. This equipment will be cleaned as follows:

1. Wash with clean potable water and laboratory detergent (Alconox or Liquinox or similar solution) using a brush if necessary to remove any particles or surface films. Decontamination solutions will be circulated through the equipment submersible pump and discharge hose;
2. Rinse thoroughly with potable water;
3. Rinse thoroughly with distilled water;
4. Allow to air dry; and
5. Wrap equipment with aluminum foil (shiny side out), if applicable, to prevent contamination if equipment is going to be stored or transported.
