John: Good morning, part of our Minocqua Cleaners contract was to perform an evaluation of the pumping well EXW-4 on Pine Street and assess for concerns for plume migration toward the Muni Well #4. The attached report is the evaluation summary and I wanted to send it to you prior to the end of the year. The assessment methods changed somewhat, in that the EXW-4 well was not shutdown (due to failing pump, etc) and this is explained in the report. We added quite a bit of review of the prior STS reports to supplement the monitoring measurements and review. This added quite a bit to the evaluation and I feel we have included a bigger picture near the Pine Street area of the site.

To give a quick summary: It appears the pumping does cause some plume migration from site areas north of the pumping well and from the direction of the source property (likely in preferential flow paths in the sand and gravel aquifer); but there is no increasing trend in the pumped water for over a decade and there are no greater than PAL chlorinated detections in the pumped water in recent years. Plus all monitoring wells in this south area are “no detect”. I think this shows a “low risk” situation for continued pumping of the well as a concern. So when you have an opportunity, take a review look and let us know any comments or questions.

The final item in our current contract is preparing a final status report of the monitoring through Round 4 (done in late Oct 2021). This report has the monitoring discussion included, but we'll update to a final status report and provide that to you later. Let me know if anything else is needed at this time.....also Happy Holidays, hope you can take some time off and your not too busy! Dick Lyster,  
MSA

Re: Assessment Near Pumping Well EXW-4  
Minocqua Cleaners State-Lead Remediation Site (BRRTS 02-44-000052)  
St. Germaine Street, Minocqua, Wisconsin

Dear John:

This letter report describes the hydrogeologic assessment of the conditions near extraction well EXW-4 at the Minocqua Cleaners site. The assessment was generally performed according to the scope of work in the MSA Professional Services, Inc. (MSA) proposal dated April 27, 2020 for work at the Minocqua Cleaners site and approved by the Wisconsin Department of Natural Resources (WDNR) on May 13, 2020.

Some variations to the proposed field program occurred in late 2020 and early 2021. This was related to the failure of the EXW-4 pump in late 2020 and early 2021, changes in personal at Lakeland Sanitary District (LSD; the operator of the remediation system at the site) in late 2020, and discussions raising concerns with shutting down EXW-4 after the semi-annual sample event of October 2020. This resulted in the decision to allow the well to operate over Winter 2020-21 and not perform the well shutdown portion of the assessment. In Winter 2020-21, well EXW-4 had continued pump problems and the pump failed and was replaced in February 2021. Following the pump replacement, well EXW-4 has continuously operated in 2021. Although the events prevented the well shutdown observations, a review of prior reports and additional well measurements were performed in 2021. This additional information and a review of the groundwater sample results through October 2021 were used to perform the EXW-4 assessment.

#### Purpose of the Well EXW-4 Assessment

The objective of the assessment is to provide information for possible decisions regarding the future operation of well EXW-4 and continued groundwater pumping at the site. Due to the continuous pumping of extraction well EXW-4 and the observed contraction of the chlorinated volatile organic compound (CVOC) plume, there are concerns that the pumping may enhance migration of the plume toward the southeast and in the direction of Municipal Well #4.

The current assessment did not perform a detailed modeling of site pumping conditions but reviewed the historical and current site monitoring data to assess the effects of pumping at EXW-4.

December 16, 2021

The assessment included installing two additional monitoring wells (i.e., wells MW-12A and MW-12B) on Pine Street and west of well EXW-4. These wells were used as water level observation wells to assess the pumping wells zone of influence (ZOI) and to collect groundwater samples to further define the plume. A field program was performed to measure water level elevations at the monitoring well nests near the pumping well EXW-4 and was used to assess the effects of the pumping well EXW-4 in the Pine Street area of the site.

#### SITE BACKGROUND INFORMATION

The attached Figure 2 - Site Layout Map shows the source property, remediation wells and site features. Well EXW-4 is in the southern area of the site on Pine Street and approximately 280 ft southeast and hydraulically downgradient of the source property on St. Germain Street. In recent years, well EXW-4 has continuously pumped relatively low-level contaminated groundwater with a pump rate of approximately 60 gallons per minute (gpm). Well EXW-4 was originally installed in 1987 and replaced in May 2017 after the original high-capacity well began pumping sand and was determined to be damaged by LSD. As of the date of this report, both wells EXW-4 and EXW-6 continue to operate and pump water to the collection manhole and cascading weir, with water discharged to the outfall at the lake.

#### Site History

The site is a former dry cleaner operation that reportedly had surface discharge of dry cleaner solvents containing tetrachloroethylene (or PCE). Chlorinated volatile organic compounds (CVOCs) are the primary contaminant of concern at the site. The original groundwater remediation system at the site was constructed in 1987 as a plume containment and hydraulic barrier system with extraction wells EXW-1 through EXW-4, with the purpose of protecting the two downgradient water supply wells (i.e., Well #3 and #4). According to the Construction Documentation Report (STS 1987), Municipal Well #3 was originally impacted and pumped for a short period with the extraction wells. Well #3 then cleaned up and was put back on-line as a water supply well.

Municipal Well #3 was 95 feet deep and was screened from 47 to 87 feet in the sand and gravel aquifer. Well #3 was permanently abandoned in January 2020 by LSD and is no longer a risk for CVOC contamination. Municipal Well #4 is approximately 520 ft southeast of the source property and remains as a potential receptor of contamination. In 2019, Municipal Well #4 was pumped at a rate of approximately 500 gpm, with a capacity to pump up to 700 gpm. In 2019, it pumped 57,360,000 gallons, which corresponds to pumping approximately 5.2 hours per day at a rate of 500 gpm. Well construction records indicate Municipal Well #4 is 90 feet deep and screened from 69 to 89 feet in the sand and gravel aquifer.

### Current Site Remediation Program

This report follows the *Status Report* dated February 26, 2020, which summarized the semi-annual groundwater monitoring results from October 2018 to October 2019. The attached Figure 3 – Well Location Map shows the location of the water supply, monitoring and remediation wells at the site.

The current site remediation program has semi-annual groundwater monitoring and discharge samples collected, with the sample events usually occurring in April and October. Two remediation wells are in continuous operation with extraction well EXW- 4 pumping at a rate of approximately 60 to 65 gpm. Extraction well EXW-6 is located on the source property and was installed in November 2006 and pumps at a rate of approximately 15 gpm. Both extraction wells have generally been in constant operation, although well EXW-4 has experienced recent pump problems and the pump was replaced and restarted in February 2021. Prior to that, the original well EXW-4 failed likely due to screen problems and was replaced with a new EXW-4 in June 2017.

### Site Geology

The subsurface at the site is composed of primarily sand and gravel outwash deposits and may have a thickness of up to 240 ft in the area, with an average thickness of approximately 100 ft over Precambrian bedrock (STS March 1988, referencing Oakes and Cotter 1975). Soil borings at the site encountered primarily fine sand (SM to SP) and fine to coarse sand (SP) with a trace gravel. Bedrock underlying the area are igneous and metamorphic rocks.

The glacial outwash deposits are the source of groundwater in the region and the aquifer at the site appears to be an unconfined, sand and gravel, glacial outwash aquifer. The municipal wells are installed in sand and gravel, unconfined aquifer conditions, to depths approximately 95 ft below ground surface (bgs). There were no significant confining layers or thick clay layers observed in the soil borings performed at the site.

According to prior reports (STS March 1988), groundwater flows from east to west (i.e. from Lake Minocqua to the municipal water supply wells) and vertical hydraulic gradients are minimal under static conditions. The report also indicates that the addition of the high-capacity barrier and extraction wells (i.e., the original EXW-1 through 4 in 1987) enhanced flow velocity and vertical groundwater gradients in portions of the site. These high-capacity wells are no longer present at the site.

The January 1986 STS report (*Minocqua Water Supply Contamination Assessment*) describes a pump test on November 13, 1985 involving Well #3. Prior to the test, the lake level was surveyed with an elevation of 1584.72 MSL and the static water level in Well #3 was 1582.2 MSL indicating a difference of 2.5 ft and a horizontal gradient toward Well #3 of 0.005 and some effects of lake level and seasonal fluctuations would be expected. The pumping test results while Well #3 was pumped at 605 gpm indicated radial flow to the well with a steep cone of depression near the well and shallow gradient farther from the well with all monitoring affected by the pumping. The pump test indicated a cone of depression indicative of an aquifer with a high permeability and transmissivity

John Sager  
Wisconsin Department of Natural Resources  
December 16, 2021

and thus a capacity for fast recharge (STS 1986). A second test at Well # 3 used 100 gpm as the pump test to simulate extraction wells. This test showed a radius of influence on the order of 200 to 250 ft, or less, with a shallow gradient. This pump rate of 100 gpm is closer to the pump rate at well EXW-4 which is approximately 60 gpm.

#### ASSESSMENT NEAR EXW-4 AND PINE STREET

In the area near well EXW-4, the monitoring wells have been installed as well nests that monitor up to three zones in the unconsolidated sand and gravel. Several of the well nests have a water table well (intersecting the water table) at depths of approximately 23 ft below ground surface (bgs), a mid-depth piezometer with an approximate depth of 60 ft bgs, and a deeper piezometer with a screened depth of approximately 85 to 90 ft bgs. Water level measurements at these well nests have been used to measure vertical gradients in the sand and gravel aquifer near extraction well EXW-4 while it is pumping and then used to estimate the well EXW-4 zone of influence.

#### Additional Monitoring Wells and T.O.C Survey Near Extraction Well EXW-4

Two additional monitoring wells were installed in July 2020 adjacent to existing well B-12 on Pine Street (refer to Figure 3- Well Location Map). The well nest was installed to help assess contaminant flow toward Pine Street and assess the plume's southern boundary. The new wells were installed as a well nest with well B-12 with a water table observation well (MW-12B) and a deeper piezometer (wells MW-12A). Well MW-12B is 27 ft deep and well MW-12A is approx. 88 ft deep.

Well B-12 was installed in 1987 and is located approximately 90 ft west of pumping well EXW-4. The original well B-12 was installed as a 4-inch well capable of being pumped as a backup well in case the original high-capacity wells would have failed or not provided enough hydraulic control. Well B-12 is 45 ft deep and has a screen that is 25-ft long (from 15 ft to 40 ft) which intersects the water table of the sand and gravel aquifer.

During the initial field measurement visits, it was noted that top of casing T.O.C. information from the older wells appeared suspect. MSA performed a new top of casing (T.O.C.) elevation survey on October 26 and 27, 2020 for all the wells located near EXW-4 and used for the assessment.

#### Water Level Measurements Near Extraction Well EXW-4

Water level measurements from observation wells, pump rate information from EXW-4, and the assessment of groundwater elevations were used for the assessment near Pine Street. The primary measurements were obtained during 10 measurement events beginning in May 2020 to November 2021. Previous water level measurements were also reviewed to confirm consistency and variations in the vertical gradients at the well nests. The water level data and vertical gradient calculations are presented in the attached Tables 1 and 2.

John Sager  
Wisconsin Department of Natural Resources  
December 16, 2021

The observed groundwater flow direction at the site has been consistent during recent years and is east-southeast across the site. A water table flow map from measurements obtained on October 25, 2021 is shown on Figure 4 and shows Municipal Well #4 is downgradient of the source property and contaminant plume.

#### Vertical Gradients

Based on previous report information, vertical hydraulic gradients under static conditions are minimal in the site area (STS 1988). Generally, they are small and upward during low water and small and downward during high water (spring). This condition is observed in well nests at the site that are beyond the areas influenced by the two pumping wells (i.e. B10/B11). Downward vertical gradients at well nests near EXW-4 are greater and indicate downward flow, as they are affected by groundwater removal from the pumping well.

Vertical hydraulic gradients were calculated from the water level measurements at the well nests and used to estimate the zone of influence (ZOI) of the pumping well EXW-4. The vertical gradients measured at the observation well nests are affected by the distance from pumping wells, the lake stage, and seasonal fluctuations of high and low water. Vertical gradients measured at wells near pumping well EXW-4 during Fall 2021 are shown on Table 1.

The following is observed regarding the vertical hydraulic gradients near pumping well EXW-4.

- Vertical groundwater gradients are generally small under static conditions for the unconfined sand and gravel aquifer. Very small vertical gradients are observed at the well nests that seem unaffected by the EXW-4 pumping well, such as well nests B-3 / B-3A, B-10 / B-11, and B-5 / B-9. These well nests are located 150 to 192 ft from pumping well EXW-4.
- Larger downward vertical gradients are observed at well nests B-2 located 75 ft from pumping well EXW-4, and B-8 located 120 ft from pumping well EXW-4. Smaller downward vertical gradients are observed at well nests B-1 located 140 ft from pumping well EXW-4, and B-12 located 80 ft from pumping well EXW-4. The general downward vertical gradients observed at these well nests indicate the water levels in the wells are affected by the pumping well EXW-4 at a pump rate of approximately 61 gpm during Fall 2021.
- An interpretation of the pumping well zone of influence (ZOI) is shown in Figure 6 with well EXW-4 pumping at 61 gpm during Fall 2021. The interpreted ZOI extends more upgradient from EXW-4, as compared to the downgradient area toward the B-5/ B-9 well nest, which often had small upward vertical gradients during the measurement events.
- A cone of depression with a shallow gradient of approximately 150 ft from EXW-4 at 61.7 gpm is generally consistent with prior pump tests performed at the site. According to the STS 1986 report, a pump test indicated a radius of influence on the order of 200 to 250 ft, or less, with a shallow gradient when Well # 3 was pumped at 100 gpm.

John Sager  
Wisconsin Department of Natural Resources  
December 16, 2021

- It is noted that EXW-4 pumping rates have been variable during the assessment and were measured at:
  - 54 gpm measured at the flowmeter on July 14 and July 15, 2020,
  - 31 gpm on September 21, 2020,
  - 24 gpm on December 4, 2020,
  - 59 gpm after the pump was replaced in February 2021, and
  - 59.4 to 61.7 gpm from April to November 2021

#### CVOC Plume Near Extraction Well EXW-4

The semi-annual monitoring results were also used to assess the plume characteristics near Pine Street and pumping well EXW-4. Monitoring results are summarized in Table 3 for site monitoring well sampling through October 25, 2021.

A map of the CVOC plume at the site based on October 25 and 26, 2021 monitoring results is shown on Figure 5. The following is observed near well EXW-4 and Pine Street.

- All monitoring wells near Pine Street are non-detect for CVOC except for pumping well EXW-4. The pumping well had detections of 1.6 ug/L trichloroethene (NR 140 PAL exceedance) and cis-1,2 DCE at 1.8 ug/L in October 2021. Other monitoring wells (B-5 and B-9) southeast of EXW-4 were "non-detect" indicating the southern extent of the plume does not extend south of Pine Street except for the pumped water from EXW-4.
- The sand and gravel aquifer is not homogeneous and the pumping well will have preferential flow layers within the sand and gravel aquifer. This may explain the low level CVOC detections that are observed in the pumped water from EXW-4, while the monitoring wells on Pine Street have recently been "non-detect" for CVOCs.
- Since installation in July 2020, new wells MW-12A and MW-12B have been sampled 4 times for VOCs from August 2020 to October 2021. The MW-12 well nest has been "non-detect" for CVOCs suggesting the plume is not present west of this well nest on Pine Street. This is confirmed with results from wells B-10 and B-11 which are also "non-detect".
- The plume evaluation included the B-2 well nest, and wells B-5 and B-9 which were not sampled since 2004 and 2010. The sampling started with the semi-annual sample event of May 2020 and all of these wells have been "non-detect" for CVOCs in the four sample rounds ending October 2021. This provides more current CVOC plume information near Pine Street and the area north of Municipal Well #4 and suggests the plume does not extend south of Pine Street in the eastern area of the site.

John Sager  
Wisconsin Department of Natural Resources  
December 16, 2021

## ASSESSMENT SUMMARY

The following summarizes the assessment near well EXW-4 and the area near Pine Street.

### Conditions Near Pumping Well EXW-4

- Downward vertical gradients near pumping well EXW-4 indicate the wells zone of influence can be estimated. The zone of influence is shown on Figure 6 and extends approximately 110 to 150 ft from the pumping well with a greater influence in a northern direction from well EXW-4.
- The monitoring results show the pumped water from EXW-4 has lower-level contamination, including Chapter NR 140 Preventive Action Limit (PAL) exceedances for TCE, and has not had an Enforcement Standard (ES) exceedance for CVOCs since 2006.
- The assessment shows the EXW-4 zone of influence does intersect the CVOC plume. As the sand and gravel aquifer is not homogeneous, the contaminated water may originate from preferred flow paths with greater hydraulic conductivity in the aquifer.
- Pumping well EXW-4 likely influences the plume movement toward the well. The well is in the downgradient direction of groundwater flow at the site, suggesting the plume will migrate in the direction of the well EXW-4 without pumping.

### Plume Assessment near EXW-4 and Municipal Well #4

- Groundwater sample results and groundwater flow direction show the position of monitoring wells B-5 and B-9 are furthest downgradient wells and have been “non detect” for CVOCs during 2020 and 2021 semi-annual monitoring. These two wells are furthest downgradient wells and monitor the plume prior to the location of Well #4.
- The new wells MW-12A and MW-12B have been sampled 4 times for VOCs from August 9, 2020 to October 25, 2021. The MW-12 well nest has been “non- detect” for CVOCs suggesting the plume is not present in this area of Pine Street.
- The monitoring wells located on Pine Street (i.e., B-10 and B-11, the B-12 well nest, and the B-2 well nest) have been “non-detect” for CVOCs since 2017. The additional wells MW-12A and MW-12 B installed in July 2020 have been “non-detect” in 4 sample rounds since

John Sager  
Wisconsin Department of Natural Resources  
December 16, 2021

installation. This suggests the plume does not extend south of Pine Street, with the exception of the pumped water from EXW-4.

### Remediation System

- Construction Documentation reports show the remediation system was originally installed to operate high-capacity extraction wells EXW-1 to EXW-5 that were installed about 1989. The purpose of the remediation system was to pump large amounts of groundwater to create a hydraulic barrier between the contaminant plume and Municipal Wells #3 and #4. The wells operated at a high pumping capacity of over 200 gpm at each well with pumped water piped to the circulation manhole and cascading wier prior to discharge of treated water at the lake.
- The current remediation system consists of wells EXW-4 and EXW-6 with a total combined pumping of approximately 75 gpm from both wells (i.e. 60 gpm at EXW-4 and 15 gpm at EXW-6) with partial CVOC removal at the cascading wier prior to discharge at the lake.

### CONCLUSIONS AND RECOMMENDATIONS

The results show pumping EXW-4 may cause some plume migration to the well from the upgradient area of the site. The pumped water has a Chapter NR 140 Preventive Action Limit (PAL) exceedance for TCE, but it has not had an Enforcement Standard (ES) exceedance for CVOCs since sampling in 2006. Therefore, as increasing trends have not been observed, it does not appear that pumping EXW-4 at the current pump rate causes a significant amount of plume migration to this area of the site. In addition, other monitoring wells near EXW-4 have been "non detect" in recent monitoring, suggesting the plume has not migrated south of Pine Street.

This suggests conditions exist to allow a possible shut-down of the extraction well EXW-4, although operating both wells EXW-4 and EXW-6 may have some benefits. The benefits include mixing of water from EXW-6 prior to discharge to the lake. Also, the two pumping wells do remove contaminated groundwater from the subsurface which is subsequently treated at the manhole and cascading weir. It is not known if pumping only one well will provide acceptable levels of remediation for the contaminated water prior to discharge to the lake.

If the pumping of water from EXW-4 and EXW-6 is discontinued, we recommend continued site groundwater monitoring for CVOCs on a frequency that will confirm the wells on Pine Street remain non-detect for CVOCs. This may require an extended period of monitoring to confirm the plume does not migrate and result in increased CVOCs in the area near Pine Street. If there are CVOC detections in monitoring wells near Pine Street during the groundwater monitoring, the option of activating well EXW-4 should be evaluated at that time.

John Sager  
Wisconsin Department of Natural Resources

## **TABLES**

**TABLE 1**  
**OBSERVED VERTICAL GRADIENTS AT WELL NESTS**  
**(With EXW-4 Pumping at Approx. 61 GPM)**

WELL NUMBERS / WELL NEST	Reference Elevation of Head Measurement (1)	Groundwater Elevation (in ft., MSL)	Vertical Hydraulic Gradient (ft./ft.) (2)	Observation
B-12 (41')	1576.60	1582.62		Generally very small downward gradients observed in the well nest 80 ft west of EXW-4 suggesting less zone of influence west of the pumping well
MW-12A (87')	1520.31	1582.59		
MW-12B (27')	1582.60	1582.60	-.00016	
80 ft W of EXW-4				
B-1B (27')	1582.71	1582.71		Generally very small vertical gradients observed in the well nest suggesting less zone of influence 140 ft NE of the pumping well
B-1A (60')	1551.6	1582.72		
B-1 (90')	1522.58	1582.70	-.00017	
140 ft NE of EXW-4				
B-8 (30.5')	1582.89	1582.89		Consistent downward vertical gradients at well nest during pumping of EXW-4 indicating downward flow NE of EXW-4
B-8A (62.5')	1543.37	1582.77	-.00304	
120 ft NE of EXW-4				
B-2B (23')	1582.55	1582.55		Consistent downward vertical gradients at well nest during pumping of EXW-4 indicating downward flow east of EXW-4
B-2A (60')	1545.42	1582.41	-.00377	
B-2B (90')	1515.72	1582.33	-.00329	
75 ft E of EXW-4				
B-3A (32')	1583.21	1583.21		Well nest appears to be outside of zone of influence of EXW-4 and shows small upward gradient in Fall 2021
B-3 (61.5')	1546.22	1583.26	+.00135	
200 ft NW of EXW-4				

WELL NUMBERS / WELL NEST	Reference Elevation of Head Measurement (1)	Groundwater Elevation (in ft., MSL)	Vertical Hydraulic Gradient (ft./ft.) (2)	Observation
B-11 (27')	1582.60	1582.60		Well nest appears to be outside of zone of influence of EXW-4 and shows small upward gradient in Fall 2021
B-10 (52') 160 ft W of EXW-4	1552.00	1582.61	+.00033	
B-5 (26')  B-9 (61.7')  150 ft SE of EXW-4	1582.44  1543.50	1582.44  1582.58	+.00365	Generally upward vertical gradients are observed at the well nest during pumping of EXW-4 with possible effects of Muni #4 if pumping during some events.

Notes:

- 1) The reference elevation of head measurement is the point half-way between the top and bottom of the slotted portion of the screen for piezometers, or the water table elevation for water table wells.
- 2) Vertical Gradient =  $\frac{\text{groundwater elevation in deep well} - \text{groundwater elevation of shallow well}}{\text{Absolute value of difference between reference elevation of head measurement}}$
- 3) Water levels in Table 1 were measured in October and November 2021 with EXW-4 pumping.

## Notes:

- Datum for Measurements is Mean Sea Level (MSL)
- Elevations for TOC of wells B-1, B-1A, B-1B, B-2, B-2A, B-3, B-3A, B-8, B-8A, B-10, B-12, MW15, MW17 were resurveyed on May 5, 2005. The bolt on the fire hydrant was the benchmark of 1603.56, as shown on basemap.
- Elevations for TOC and ground surface of wells B-5, B-9 were resurveyed on July 30, 2008.
- Elevations for TOC for well nest wells near EXW-4 (B-12, B-2, B-5 /B-9, B-1, B-8, B10/B11) were re-surveyed by MSA on Oct 26, 2020 using B-8 T.O.C. as benchmark at elev. 1602.86.
- This Table 2 shows Orange shading as indicating downward vertical gradient between well screen zones and yellow indicates upward vertical gradient between well screen zones at the respective well nest.
