Re: Waste Management Progress Report No. 10 For Period May 19, 2021 to May 18, 2022 Bioremediation Pilot Test – 2021 Field Season Former DuPont Barksdale Works Site FID No.: 804009140 EPA ID No.: WIR000133447 BRRTS No. 02-04-000156

Dear Mr. Nave:

This letter report provides a summary of ongoing Bioremediation Pilot Test Program (BPTP) work conducted in 2021 at the Former E. I. du Pont de Nemours and Company (DuPont) Barksdale Works site (Site). This letter not only documents work completed during the reporting period, but provides the information required by the Wisconsin Department of Natural Resources (WDNR) to fulfill Condition 7 of the Hazardous Waste Remediation Variance (HWRV) permit for Biodegradation of Contaminants and Removal of Residual Product and Debris.

1.0 BACKGROUND INFORMATION

The Barksdale BPTP is focused on biodegradation of nitroaromatic and nitramine organic compounds (NNOCs) in soil. The BPTP began in 2007 with the construction of four small in-situ till areas (cells) intended to evaluate the effect of water, oxygen, and pH on the rate of in-situ microbial degradation of 2,4- and 2,6-dinitrotoluene (DNT or "primary site-related DNT isomers") in site soil as a possible alternative to conventional remedies. These original cells are identified as cell locations C01 through C04 on Figure 2 and in total encompassed an area approximately 50 feet by 20 feet or 1,000 square feet.

Early results indicated that degradation of the two primary site-related DNT isomers was feasible; however, the presence of various other NNOCs was observed to affect degradation rates. As such, the program was expanded in 2008 to evaluate the range of this observed effect by adding three more cells that contained less complex NNOC mixtures. After initiating tilling, several of the 2008 cells were found to contain solid pieces of residual product that resulted in cell heterogeneity and limited the analysis of the test results. As a result, six additional cells with similar trinitrotoluene (TNT)/DNT ratios were constructed in 2009 at locations where the majority of such solids could be removed manually prior to tilling. Also, in 2009, one of the 2008 cells was expanded to four times its original size with the construction of two contiguous new cells in order to evaluate potential economies of scale in cell operation. The cells constructed in 2008 and 2009 are identified as C05 through C15 on Figure 2.

Mr. Bradley S. Nave The Chemours Company FC, LLC May 31, 2022 Page 2 of 10

In 2010, NNOCs were discovered within a sandy soil matrix during investigation of new areas of the site. Because all cells constructed prior to 2010 had been in clayey soil, three additional cells (C16 to C18) were added in 2011 to evaluate degradation in the alternate soil type. All debris and product residues encountered during development of the first 18 cells was collected, containerized, and shipped off-site for incineration.

Prior to issuance of the HWRV permit, there were several limitations with respect to construction, soil and waste handling, and test evaluation for the first 18 cells. These limitations included:

- Having to incinerate soil removed during cell construction, which would have otherwise been amenable to biodegradation.
- Having to remove product either by bulk removal prior to cell construction or by manually removing product solids on a periodic basis from the cell surface after tilling was initiated.
- Not having permission to consolidate disjointed areas for testing.
- Having limitations on the ability to control water content within the cells driven by the fact that all cells had to be constructed in-situ.

To address these constraints on the BPTP, The Chemours Company, FC, LLC (formerly DuPont), at the suggestion of WDNR, requested a hazardous waste remediation variance permit in July 2010. Following Chemours response to several sets of agency comments, WDNR issued the HWRV on May 22, 2012. The HWRV permit specifies that a total of 10,000 cubic yards of soil may be treated during the course of the BPTP.

Since June 2012, 21 additional cells have been constructed within the area of concern (AOC) identified at the site. Cells C19, C20, C21, and C22 were constructed in 2012 to accommodate and evaluate material removed in and around areas investigated.

Cell C23 was constructed in 2013 to support a proof of concept study in conjunction with the United States Army Corp of Engineers (USACE) to evaluate degradation of TNT and other NNOCs by introducing hydrated lime to accelerate waste degradation processes. The study on cell C23 was completed in 2014 and waste soils were subsequently removed from the cell and stored for further study or to await future treatment or incineration. Soils stored from the cell were placed in cells C12, C17, and C22 during the 2017 field season. Cell C23 was dismantled in 2021 to make room for the construction of a structure to support the soil heating test cell (C40) that was approved in the December 2020 HWRV permit modification.

Further site investigation between 2014 and 2021 identified soil that contained varying concentrations of fine grained (i.e., sand sized or smaller) TNT. Cells C24 through C39 were constructed during this time period to store, test, and treat this fine-grained material with methods developed as a direct result of the C23 study.

Table 1 lists the cells currently in place and includes information regarding their volume, status, and contaminant mass. Pilot test activities performed under the HWRV are conducted within the designated AOC. Any debris or product removed from cells is handled in accordance with Resource Conservation and Recovery Act (RCRA) rules, including land disposal restrictions (LDRs) and Best Demonstrated Available Technology (BDAT) requirements.

2.0 REPORTING REQUIRED BY THE VARIANCE

Condition 7 of the HWRV requires that annual progress reports be submitted to the department in accordance with s. NR 724.13(3), Wis. Adm. Code. The annual reports are required until the variance ends on May 18, 2023 and are due on or before June 1st of each year. Progress

Mr. Bradley S. Nave The Chemours Company FC, LLC May 31, 2022 Page 3 of 10

reports required by Condition 7 must be submitted annually in accordance with s. NR 724.13(3), and must include:

- a. Documentation of the type and amount of product residuals and debris removed from biopilot cells. Documentation of any characterization and container storage of product residuals and debris removed from biopilot cells. Documentation of disposal of any product residuals and debris removed from the biopilot cells including manifest copies.
- b. Documentation of any management, including consolidation, of discrete areas where impacted soil is located within narrow locations such as former ditches or locations that are contorted by the layout of former building features. Documentation of the location of those areas and the amount of soil that is moved. Documentation of the location of areas where the soil combined from discrete source areas is managed.
- c. Documentation of any alternative treatment of large debris that facilitates management, including washing and physical resizing of large debris for off-site disposal. Documentation of management of all impacted waste streams generated by these activities, including amounts and volumes of waste treated and generated.

Certified laboratory analytical testing for effectiveness, waste collection, management, and disposal associated with construction and operation of the BPTP are addressed in this progress report. Laboratory reports for 2021 data referenced in this report are included in Appendix E.

2.1 Progress of the Bioremediation Pilot Test Program

2.1.1 Contaminant Removal

Table 1 includes estimates of contaminant mass removed within the biopilot test program over the calendar year and to date, as well as, estimated contaminant mass remaining for each cell and constituent of potential concern (COPC). The estimated masses indicated in Table 1 are based on averaged values for all samples collected in a given cell at the first sampling of a COPC and in the most recent events that included that COPC (typically multiple locations within a cell to form a composite sample). Observations on contaminant removal during the past pilot test season are provided below.

- Distribution of COPCs in the soil in the cells is heterogeneous. As a result, the concentrations of a few COPCs are shown to have increased over time on Table 1. However, statistical analysis based on data collected across the full duration of the program show overall concentrations are decreasing. Such heterogeneity effects are more apparent in the single season product removal estimates than in the long-term, overall removal values. The apparent mass increases shown on Table 1 are generally on the order of a few micrograms per kilogram (µg/kg) and some of the apparent increases are due to changes in reporting/detection limits within the duration of the project.
- To date, an estimated total of 12,987 pounds of COPCs in soil has been destroyed/removed via on-site mitigation efforts in the entirety of the BPTP (Table 1).
- Approximately ninety percent of the COPCs being tracked have shown decreases over the life of the pilot program.
- Laboratory reporting limits (RLs) were compared to Residual Contaminant Levels (RCLs) for direct contact as shown on Table 4. This comparison shows that the laboratory RLs are below the direct contact RCLs and are considered suitable for making risk management decisions.

Mr. Bradley S. Nave The Chemours Company FC, LLC May 31, 2022 Page 4 of 10

2.1.2 Reporting Period Operational Issues

No operational issues were encountered during the reporting period.

2.1.3 Evaluation of System Effectiveness

In general, the analytical results continually show that the reduction approaches being tested show promise for remediation of affected site soil, but the evaluation is on-going to determine if the process will be effective in reaching site-wide remedial goals for the varying COPC mixtures found in site soil.

Because this is a pilot test program, the activities do not address all impacted areas on the site; therefore, discussion of site-wide monitored natural attenuation and case closure are not applicable.

An evaluation of soil concentrations of primary COPCs (TNT, 2,4-DNT, and 2,6-DNT) in cells in comparison to site-specific recreational RCLs for direct contact is included in the summary below:

		pН	Soil Volume			
	Sampled in	Adjustment	in Cell	TNT	2,4-DNT	2,6-DNT
Cell	2021	Cell	(cubic yards)	Below RCL	Below RCL	Below RCL

C39	No	No	0.0	NS	NS	NS

Notes:

RCL: Site-specific recreational direct contact RCL. Soil concentrations are considered to be below the RCL if the calculated 95% upper confidence level for the analyte is below the RCL.

TBD: To be determined. Additional sampling is planned to refine the statistical analysis.

NS: Not sampled

Additional detail regarding the status of the cells during the reporting period is as follows:

- Existing biodegradation test cells C01 to C05, C07 to C11, C13 to C15, C18 to C20, C22, C23, C29, C30, C32, C34, and C39 were not mixed or actively tested in 2021.
 - Control cell C01 was not sampled in 2021 because historical analytical testing has showed that COPC concentrations have generally stabilized.
 - COPC concentrations in cells C02 through C05, C07 through C11, C13 through C15, and C18 through C20, were below site-specific recreational RCLs for direct contact on average. These cells were seeded prior to 2021 and observed for vegetation regrowth, which was successful. Photos of select cells showing examples of vegetation cover are included in Appendix D.
 - Cell C22 has not yet been fully loaded with soil and currently only contains approximately 1 cubic yard of soil. Cell C22 was constructed to evaluate reduction of di- and tri- nitroxylene (DNX and TNX) impacted soil. Loading of additional soil in cell C22 has been postponed pending further bench scale testing to evaluate the methods of degradation for DNX and TNX impacted soil.
 - The soil tested in cell C23 was containerized at the close of the 2013 field season and was unused after. The limited amount of affected residual soil formerly located in C23 was relocated to C22 (1 cubic yard), C12 (0.9 cubic yards), and C17 (0.8 cubic yards) in spring 2017 based on the similarities of the constituents present in each of the destination cells. Cell C23 was fully dismantled in 2021 to make room for the construction of the soil heating test cell (cell C40).
 - Cells C29, C30, C32, and C39 have not yet been loaded with soil. Cell C39 was constructed in 2021.
 - Cell C34 was partially loaded prior to 2021, and it is anticipated that lime addition, mixing and sampling will occur after the cell has been loaded to capacity.
 - Willow trees were planted in cell C09 prior to 2021 to evaluate the ability of the trees to control pore water. COPC concentrations fell below site-specific recreational RCLs for direct contact in 2010.
- Cells C06, C12, C17, C21, C24 to C28, C31, C33 and C35 through C38 are alkaline hydrolysis (AH) cells. These cells have been mixed with hydrated lime to adjust soil pH as allowed under the HWRV to treat elevated NNOC concentrations in soil.
 - Composite soil samples were collected from cells C24, C28, C31, C33, C35, C36 and C37 in 2021.

- COPC concentrations in cell C06, C17, C26 and C27 were below site-specific RCLs for direct contact on average and therefore not sampled.
- Soil samples were not collected from cells C12 and C21 in 2021 as the cell contents are planned to be excavated as part of ongoing site investigation work.
- Soil from cell C16 was excavated and placed in C25 in 2020 to access a former drainage ditch for site investigation work.
- Approximately 303 cubic yards of soil was added to cell C37 in 2021. With the 144 cubic yards of soil added in 2020, the total volume of soil in cell C37 is 447 cubic yards. The cell was mixed with a mix head attached to an excavator, following the application of lime.
- Cell C38 was constructed and partially loaded in 2021. Approximately 519 cubic yards of soil was added to cell C38 in 2021. The cell was mixed with a mix head attached to an excavator, following the application of lime.
- Heating cell C40 was constructed, loaded with non-contaminated soil, water, and hydrated lime in 2021. The insulated cell was constructed using poured concrete walls and floor with three removable wood framed roof sections. Cell C40 is an in ground constructed cell. The walls and roof were designed to retain heat. Results of a soil heating pilot test conducted within the cell showed that the soil mixture could effectively be heated to temperatures above the melt temperature of TNT (176 degrees F) while remaining below the TNT self-detonation temperature (approximately 450 degrees F). The mixture was heated to an average temperature of approximately 230 degrees F in 13 days using nine electric resistive heaters.

With the completion of the 2021 field season, the total volume of soil currently loaded into cells is 8,233 cubic yards. Approximately 4,287 cubic yards of the 8,233 cubic yards total of soil referenced above is located in cells that are considered to be below site-specific recreational RCLs for direct contact. The remaining 3,946 cubic yards of soil are considered to be currently under remediation.

See Figure 5 for the general design of cells C1 through C22. See Figure 6 for the general design of cells C24 through C39 (ex-situ, lime addition cells). Figure 7 shows Pilot Heating Cell C40.

2.1.4 System Status and Recommended Future Work

The BPTP has treated approximately 12,987 pounds of site contaminants to date (Table 1). The initial quantity of contaminants placed in all cells was approximated at 14,686 pounds. With the addition of 2021 contaminated soils, the approximated quantity of COPCs in current cells is estimated to be 1,699 pounds. A visual representation of the cell data is provided in Appendix C.

Work proposed for the 2022 field season includes:

- Results of the vegetative regrowth in cells C05, C07, C08, C10, C11, C13 through C15, and C18 through C20 will continue to be evaluated, and re-seeding will be conducted if necessary.
- Alkaline hydrolysis (via pH adjustment) cells C06, C24, C26, C28, C31, C33, C35, C36 and C37 will continue to receive monitoring, if necessary.
- Cells C29, C30, C32 and C39 are currently empty and may be utilized as needed in 2021.
- Cells C34 and C38 will continue to be loaded with soil, as needed, and sampled if cell capacity is reached.

- Soil heating tests will continue using soil impacted with NNOCs at cell C40 to evaluate pilot scale techniques and rates.
- Up to two new cells (C41 and C42) are proposed for construction in 2022. These cells will be built using the general design depicted in Figure 6. The cells will be constructed to hold soil generated during site investigation work. The specific locations of the new cells have not yet been determined.

An additional 100 to 1,500 cubic yards of soil is anticipated to be treated under the HWRV at the end of 2022. With the anticipated additional soil added in 2022, the total amount of soil treated under the HWRV will be within the permitted maximum of 10,000 cubic yards. Considerations will be made to eliminate the soil volume from cells with soil concentrations below site-specific recreational RCLs for direct contact from the 10,000 cubic yard maximum, if needed.

2.2 Site Maps

Site maps are provided in Figures 1 through 4. Figures 2 through 4 provide the locations of the test cells. Figures 5 through 7 provide details of the construction of the existing cells.

2.3 Data Presentation

Table 1 provides data indicating the progress of soil bioremediation. Table 2 lists debris and residuals removed in the reporting period. Table 3 lists the source and quantities of soil moved to cells in the reporting period. Table 4 provides a comparison of RCLs to laboratory reporting limits.

2.4 Data Documentation

Manifests for waste materials removed from site are attached in Appendix B. Scatter plots for contaminant trend monitoring are attached in Appendix C. Laboratory analytical reports are attached in Appendix E.

2.5 Reporting Form

A completed copy of WDNR Form 4400-194: "Remediation Site Operation, Maintenance, Monitoring & Optimization Report" is attached in Appendix A.

2.6 Product Residuals and Debris Removed from Bioremediation Pilot Cells [Condition 7a]

The cited variance condition requires:

- Documentation of the type and amount of product residuals and debris removed from biopilot cells.
- Documentation of any characterization and container storage of product residuals and debris removed from biopilot cells.
- Documentation and disposal of any product residuals and debris removed from the biopilot cells including manifest copies.

No residual solid product was manually removed from cells within the reporting period.

2.7 Product Residuals and Debris Removed

Debris managed and/or removed by site investigation work during the current reporting period included metal, concrete, and residual solid product (RSP) from historical operations within the AOC. Debris was screened in the field using an amplifying fluorescent polymer meter (FIDO[®]) and/or a colorimetric identification spray (Expray[®]). Debris removal locations are indicated on

Mr. Bradley S. Nave The Chemours Company FC, LLC May 31, 2022 Page 8 of 10

Figures 3 and 4. Table 2 provides a summary of debris handled on-site during the 2021 field season.

2.7.1 Residual Solid Product

RSP was collected during the current reporting period in the Use Area PAD drainage ditch PADD0001 in 2021 (Table 2). Approximately five pounds of RSP was removed from Use Area PAD in 2021. The RSP was containerized, wetted, and shipped to USACE in Vicksburg, Mississippi for use in laboratory tests to support the soil heating evaluation permitted in the last HWRV modification.

The permitted on-site magazine currently contains an estimated 124 pounds RSP, which is contained within a mixture of soil and water. This weight is estimated since recovered RSP is typically found mixed with soil and is not able to be separated. The total weight of the RSP/soil/water mixture present in the magazine is 254 pounds. This material was collected during the 2019 and 2020 field seasons and has been held for possible use in heated alkaline hydrolysis testing and for as needed study at the USACE's laboratory in Vicksburg, MS.

2.7.2 Concrete

Approximately 405 cubic feet of concrete was removed from Use Area PAK in 2021. Field screening of the concrete encountered in 2021 did not indicate the presence of NNOCs. The concrete was managed within the AOC and moved to a concrete stockpile in Use Area PAH.

2.7.3 Metal

Metallic debris, including a culvert, pipe, and banding material, was encountered in Use Areas PAK and PAH in 2021. The culvert and pipe had visible internal channels that allowed for field screening. Metallic debris for which field screening did not indicate the presence of NNOCs was transported to a metal stockpile area (SAK-SP01). Approximately 30 pounds of metal debris screened positive for NNOCs and was moved to cell C28 pending additional accumulation.

2.7.4 Wood

Approximately 3,137 pounds of plywood and wood railroad ties that were placed in cell C23 during historical biopilot testing were removed when the cell was deconstructed in 2021. The wood was placed in a site-designated roll-off container (SAJ-WP01) in 2021. The roll-off container was shipped to Veolia ES Technical Solutions (USEPA ID ILD098642424) in Sauget, Illinois for incineration on October 18, 2021.

2.7.5 Vitrified Clay Pipes (VCP)

Vitrified clay pipe was not encountered in 2021.

2.7.6 Suspect Asbestos Containing Material

Approximately 52 pounds of suspect asbestos containing material was encountered in the area of the soil heating pilot cell in Use Area SAJ. The material was placed in a labeled bag. The bag is currently stored in a drum on-site pending additional accumulation of asbestos for off-site disposal.

2.7.7 Water

As part of site investigation work, approximately 800 gallons of decontamination water (e.g. hand and boot washes and equipment/tool decontamination) and approximately 3,500 gallons of ponded stormwater from Use Area PAJ was applied to test cells. The water was used to

Mr. Bradley S. Nave The Chemours Company FC, LLC May 31, 2022 Page 9 of 10

hydrate soil in alkaline hydrolysis cells. The on-site wastewater treatment unit was not operated in 2021.

2.7.8 Rubber/Plastic

Approximately 8,043 pounds of rubber/plastic liner and matting that was placed in cell C23 during historical biopilot testing was removed when the cell was deconstructed in 2021. The matting and liner from cell C23 and an approximately 10-pound segment of plastic culvert from ditch PAHD0076 were placed in a designated roll-off container (SAJ-WP01). The roll-off container was shipped to Veolia ES Technical Solutions (USEPA ID ILD098642424) in Sauget, Illinois for incineration on October 18, 2021.

2.7.9 Other

An estimated 50 pounds of debris consisting of used personal protective equipment (PPE), plastic buckets, tarps, and sampling/decon supplies were consolidated into a site-designated roll-off container (SAJ-WP01) in 2021. The roll-off container was shipped to Veolia ES Technical Solutions (USEPA ID ILD098642424) in Sauget, Illinois for incineration on October 18, 2021. An additional 75 pounds of debris consisting of used PPE and sampling/decon supplies generated after October 18, 2021 was containerized and stored on-site pending additional accumulation.

2.8 Movement of Soil into Pilot Cells [Condition 7b]

The cited variance condition requires:

- Documentation of any management, including consolidation, of discrete areas where impacted soil is located within narrow locations such as former ditches or locations that are contorted by the layout of former building features.
- Documentation of the location of those areas and the amount of soil that is moved.
- Documentation of the location of areas where the soil combined from discrete source areas is managed.

A total of 303 cubic yards of soil was placed into cell C37 and 519 cubic yards of soil was placed into cell C38 in 2021. Table 3 lists the source areas and destinations of the soil managed during the current reporting period, and locations are provided on Figure 3.

2.9 Alternative Treatment of Large Debris [Condition 7c]

The cited variance condition requires:

- Documentation of any alternative treatment of large debris that facilitates management, including washing and physical resizing of large debris for off-site disposal.
- Documentation of management of all impacted waste streams generated by these activities, including amounts and volumes of waste treated and generated.

This section describes alternative treatment of debris that potentially contained RCRA hazardous constituents. As detailed in Section 2.7, field screening of some of the debris did not indicate the presence of hazardous constituents and was therefore managed as non-regulated debris. Some non-regulated debris may be stored and resized to facilitate on-site reuse as aggregate or to meet off-site industrial facility acceptance requirements.

No alternative debris treatment or management of metallic debris was conducted in 2021. No impacted concrete debris was encountered in 2021. Management of water is detailed in Section 2.7.7.

NOTES:

¹Total DNT calculated by adding 2,3-, 2,4-, 2,5-, 2,6-, 3,4-, and 3,5-DNT isomers. Denotes an increase over time. Many of the apparent increases are due to changes in detection limits within the duration of the project and heterogeneity effects. 2-A-4,6 DNT and 4-A-2,6 DNT increases may be associated with the anaerobic degradation of TNT. Red Data (#.#)

Data Compilation Summary

If multiple samples were analyzed from a single cell during a single sampling event, the average concentration of the samples was calculated.

Results reported below the reporting limit have been rounded to zero to compare varying/changing limits: over multiple years, using different laboratories, concentration dilutions, etc.

To calculate analyte weights, the following formula was used:

Analyte Concentration (mg/kg)	х	Volume of Soil in Cell (cuyd)	x	Estimated Soil Weight per Cubic Yard of Soil (2,700 lbs / cuyd)	x	Soil Concentration Conversion Factor from Parts Per Million (1 kg / 1,000,000 mg)	=	Recorded Analyte Concentration per Cell in Pounds (lbs)
------------------------------------	---	---------------------------------------	---	---	---	--	---	--

NOTES:

¹: Total DNT calculated by adding 2,3-, 2,4-, 2,5-, 2,6-, 3,4-, and 3,5-DNT isomers.

Gray Cells with numbers (#.#):
 Cell was emptied in 2014. The remaining contents from the C23 stored soils were placed in cells C12, C17, and C22 in 2017.

C16^A: Cell was emptied in 2020. Contents of C16 (approximately 177 cubic yards) and portions of the cell base and berm that were in contact with the cell contents (approximately 158 cubic yards) were placed in emptied cell C25 in 2020.

C25^B: Cell C25 was filled with material from Cell C16 in 2020.

C25^C: Material originally placed in cell C25 (approximately 250 cubic yards of soil) was added to cell C27 in 2019.

C27^D: Material originally placed in cell C27 prior to cell C25 contents being added in 2019.

C27^E: Material originally placed in cell C27 plus material added from cell C25 in 2019.

NOTES:

1: Total DNT calculated by adding 2,3-, 2,4-, 2,5-, 2,6-, 3,4-, and 3,5-DNT isomers.

Initial analyte concentrations: Not all analytes were initially sampled for each cell. TNX, some DNX & DNT isomers and 3,5-Dinitroaniline were added to the sampling program at later dates. The initial reading for each analyte included on this table are from the earliest recorded data set for each analyte.

0.0 Values: The constituent was not detected above the Reporting Limit (RL) and was rounded down to zero.

NA: Not analyzed/applicable C23*: Cell was emptied in 2014. The remaining contents from the C23 stored soils were placed in cells C12, C17, and C22 in 2017. C16^A: Cell was emptied in 2020. Contents of C16 (approximately 177 cubic yards) and portions of the cell base and berm that were in contact with the cell contents (approximately 158 cubic yards) were placed in emptied cell C25 in 2020.

C25^B: Cell C25 was filled with material from Cell C16 in 2020.

C25^C: Material originally placed in cell C25 (approximately 250 cubic yards of soil) was added to cell C27 in 2019. Totals shown in this column not included in "Total for All Cells" column.

C27⁰: Material originally placed in cell C27 prior to cell C25 contents being added in 2019. Totals shown in this column not included in "Total for All Cells" column.

C27^E: Material originally placed in cell C27 plus material added from cell C25 in 2019. Totals shown in this column are included in "Total for All Cells" column.

NOTES:

¹: Total DNT calculated by adding 2,3-, 2,4-, 2,5-, 2,6-, 3,4-, and 3,5-DNT isomers. 0.0 Values: The constituent was not detected above the Reporting Limit (RL) and was rounded down to zero. Red Data (##): Denotes an increase over time. Many of the apparent increases are due to changes in detection limits within the duration of the project and heterogeneity effects. 2-A-4,6 DNT and 4-A-2,6 DNT increases may be associated with the anaerobic degradation of TNT.

NA: Not analyzed in 2020 and/or 2021

C23²: Cell was emptied in 2020. Contents of C16 (approximately 177 cubic yards) and portions of the cell base and berm that were in contact with the cell contents (approximately 158 cubic yards) were placed in emptied cell C25 in 2020.

C25^B: Cell C25 was filled with material from Cell C16 in 2020.

C25^c: Material originally placed in cell C25 (approximately 250 cubic yards of soil) was added to cell C27 in 2019. C27^b: Material originally placed in cell C27 prior to cell C25 contents being added in 2019.

C27^E: Material originally placed in cell C27 plus material added from cell C25 in 2019.

2021 Contaminant Progress Summary Analyte Decrease Initial to 2021

Waste Management Progress Report No. 10 For Period May 19, 2021 to May 18, 2022 Hazardous Waste Remediation Variance Approval of May 22, 2012 Hazardous Waste Remediation Variance Renewal Approval of May 18, 2017 Former Barksdale Works

Bayfield County, Wisconsin

Many of the apparent increases are due to changes in detection limits within the duration of the project and heterogeneity effects. 2-A-4,6 DNT and 4-A-2,6 DNT increases may be associated with the anaerobic degradation of TNT. NA: Not analyzed/applicable Gray cells with numbers (##): These cells were not sampled in 2021. Decreases shown are from initial reading to the most recent data available for each cell.

C23⁺: Cell was emptied in 2014. The remaining contents from the C23 stored soils were placed in cells C12, C17, and C22 in 2017. C16^A: Cell was emptied in 2020. Contents of C16 (approximately 177 cubic yards) and portions of the cell base and berm that were in contact with the cell contents (approximately 158 cubic yards) were placed in emptied cell C25 in 2020.

 $\text{C25}^{\text{B}}\text{:}$ Cell C25 was filled with material from Cell C16 in 2020.

C25^C: Material originally placed in cell C25 (approximately 250 cubic yards of soil) was added to cell C27 in 2019.

C27^D: Material originally placed in cell C27 prior to cell C25 contents being added in 2019.

C27^E: Material originally placed in cell C27 plus material added from cell C25 in 2019.

Notes:

¹: Reporting limits ranged from 0.20 to 0.21 mg/kg when laboratory dilution was equal to 1. Reporting limits were higher where dilution was required.

Not analyzed = With the exception of nitroglycerin, the compounds listed as not analyzed were not used or manufactured on-site. This is supported by historical analytical sampling for these compounds. Nitroglycerin was manufactured on-site; however, the manufacturing operation was located in the Boyd Creek valley and not associated with the bio-pilot test cells.

RCL = Residual Contaminant Level for direct contact

WDNR Form 4400-194: Remediation Site Operation, Maintenance, Monitoring & Optimization Report

Remediation Site Operation, Maintenance, Monitoring & Optimization Report

Form 4400-194 (R 06/20)

Page 1 of 29

GENERAL INSTRUCTIONS, PURPOSE AND APPLICABILITY OF THIS FORM:

Completion of the applicable portions of this form is required under Wis. Admin. Code § NR 724.13(3). Failure to submit this form as required is a violation of that rule section and is subject to the penalties in Wis. Stats. § 292.99. This form must be submitted every six months for remediation projects that report operation and maintenance progress, in accordance with Wis. Admin. Code §. NR 724.13(3). A narrative report or letter containing the equivalent information required in this form may be submitted in lieu of the actual form. Submittal of this form is not a substitute for reporting required by department programs such as Waste Water or Air Management.

Notes:

- Long-term monitoring results submitted in accordance with Wis. Admin. Code § NR 724.17(3) are required to be submitted within 10 1 business days of receiving sampling results and are not required to be submitted using this form. However, portions of this form require monitoring data summary information that may be based on information previously submitted in accordance with that section of code.
- Responsible parties should check with the department Project Manager assigned to the site to determine if this form is required to be 2 submitted at sites responded to under the Federal Comprehensive Environmental Response and Compensation Act (commonly known as Superfund) or an equivalent state-lead response.
- Responsible parties should check with the department Project Manager assigned to the site to determine if any of the information 3 required in this form may be omitted or changed and should obtain prior written approval for any omissions or changes.
- Responsible parties are required to report separately on a semi-annual basis under Wis. Admin. Code § NR 700.11(1). Reporting 4 under that provision is through an internet-based form. More information can be found at: http://dnr.wi.gov/topic/Brownfields/documents/regs/NR700progreport.pdf.
- Personally identifiable information on this form is not intended to be used for any other purpose than tracking progress of the 5. remediation by Remediation and Redevelopment Program. Personal information collected will be used for administrative purposes and may be provided to requesters to the extent required by Wisconsin's Public Records Law (Wis. Stats. §§ 19.31–19.39).

Remediation Site Operation, Maintenance, Monitoring & Optimization Report

Form 4400-194 (R 06/20)

Page 2 of 29

() Yes () No

• Yes • No

Yes No

Yes NoYes No

12. If soil is treated ex situ, is the treatment location off site?			С)Yes 🧿	No No
If yes, give location: Region	County				
Municipality name O City O Town O Village	Township Ra	nge O E O W	Section	1⁄4	1/4 1/4

B. Remediation Method

Only submit sections that apply to an individual site. Check all that apply:

Landspreading/thinspreading of petroleum contaminated soil (submit a completed Section ES-2).

Other ex situ remediation method (submit a completed Section ES-3).

Site is a landfill (submit a completed Section LF-1).

Biopiles (submit a completed Section ES-1).

Other in situ soil remediation method (submit a completed Section IS-3).

Soil natural attenuation (submit a completed Section IS-2).

Soil venting (including soil vapor extraction building venting and bioventing submit a completed Section IS-1).

Other groundwater remediation method (submit a completed Section GW-4).

Groundwater natural attenuation (submit a completed Section GW-3).

In situ air sparging (submit a completed Section GW-2).

Free product recovery (submit a completed Section GW-1).

Groundwater extraction (submit a completed Section GW-1).

C. General Effectiveness Evaluation for All Active Systems

If the remediation is active (not natural attentuation), complete this subsection.

1. Is the system operating at design rates and specifications?

If the answer is no, explain whether or not modifications are necessary to achieve the goal that was previously established in design.

2. A	re modification	s to the	system	warranted	to	improve	effective	eness
------	-----------------	----------	--------	-----------	----	---------	-----------	-------

If yes, explain:

Results of prior seasons' testing are used to improve system performance in subsequent test cells. Current data indicate that elevated (above ground) cells and adjustments to pH are likely to accelerate remediation; however, data are still being acquired to support this finding.

3.	Is natural	attenuation	an	effective	low	cost	option	at this	time?
----	------------	-------------	----	-----------	-----	------	--------	---------	-------

4. Is closure sampling warranted at this time?

5.	5. Are there any modifications that can be made to the remediation to improve cost effect	tiveness?
	If yes, explain:	

Site name: Former DuPont Barksdale Works		Remediation Site Operation, Maintenance
Reporting period from: 05/19/2021	To:05/18/2022	Monitoring & Optimization Report

D. Economic and Cost Data to Date	
1. Total investigation cost:	
2. Implementation costs (design, capital and installation costs, excluding investigation costs:	
3. Total costs during the previous reporting period:	
4. Total costs during this reporting period:	
5. Total anticipated costs for the next reporting period:	

6. Are any unusual or one-time costs listed in the reporting periods covered by D.3., D.4. or D.5. above?

If yes, explain: System is a pilot test. Economic and cost data is not applicable.

7. If closure is anticipated within 12 months, estimated costs for project closeout:

E. Name(s), Signature(s) and Date of Person(s) Submitting Form

Legibly print name, date and sign. Only persons qualified to submit reports under ch. NR 712 Wis. Adm. Code are to sign this form for sites with any ongoing active remediation, monitoring or an investigation. Other persons may sign this form for sites with no response activities during the six month reporting period.

Registered Professional Engineers:

Section GW-2, In Situ Air Sparging Systems

A. In Situ Air Sparging System Operation

1. Number of air injection wells at the site and the number actually in use during the period:

2. Number of days of operation (only list the number of days the system actually operated, if unknown explain):

To:05/18/2022

3. System utilization in percent (days of operation divided by reporting time period multiplied by 100). If < 80%, explain:

B. System Effectiveness Evaluation

- 1. If free product is not present, determine the single contaminant that requires the greatest percent reduction to achieve ch. NR 140 ES and PAL. Perform this calculation for all contaminants that were present at the site that have ch. NR 140 standards. Use the highest contaminant concentration measured in any sampling points during reporting period. If free product is present, write "FREE PRODUCT" in B.1.a.
- a. Contaminant:
 b. Percent reduction necessary to reach ch. NR 140 ES and PAL:
 c. Maximum contaminant concentration level in any monitoring well:
 upg/L

 2. Is there any evidence that air is short circuiting through natural or man-made pathways?

 Yes O No If yes, explain:

 3. Is the size of the plume: O Increasing O Stabalized O Decreasing ?

C. Additional Attachments

Attach the following to this form:

- Groundwater contour map.
- · Groundwater contaminant distribution map (may be combined with contour map).
- When contaminants are aerobically biodegradable, attach a dissolved oxygen in groundwater map (dissolved oxygen may be combined with the contaminant data on a single map).
- Site map with all air injection wells and groundwater monitoring points.
- Graph of contaminant concentrations versus time for the contaminant listed in B.1.a. (above) for the monitoring point with the greatest level of contamination.
- Groundwater contaminant chemistry table.
- Groundwater elevations table.
- System operational data table.

Remediation Site Operation, Maintenance, Monitoring & Optimization Report

A. Effectiveness Evaluation				
 If free product is not present, determine PAL. Perform this calculation for all cor concentration measured in any samplir 	 the single contaminant that re ntaminants that were present at ng points during reporting perior 	quires the greatest percent reduc the site that have ch. NR 140 sta d. If free product is present, write	ion to achieve ch. NR 140 ndards. Use the highest c "FREE PRODUCT" in A.1) ES and ontaminant .a
a. Contaminant:				
b. Percent reduction necessary to re-	ach ch. NR 140 ES and PAL:			%
c. Maximum contaminant concentrat	ion level in any monitoring we	Il of that contaminant:		µg/L
2. Aquifer parameters:				
a. Hydraulic conductivity:				cm/sec
b. Groundwater average linear veloc	ity:		hV	ft/yr
3. Is there a downgradient monitoring w	vell that meets ch. NR 140 sta	ndards?	Yes 🔿 No	
4. Based on water chemistry results, is	the plume: O Expanding C) Stabalized O Contracting	2	
5. If the answer in 4. (above) is "expand If yes, explain:	Jing," is natural attenuation sti	II the best option?	🔵 Yes 🔵 No	
6. Biodegradation parameters:				
a. Upgradient (or other site specific b	background) DO level:			µg/L
b. DO levels in the part of the plume	that is most heavily contamin	ated		µg/L
7. Is site closure a viable option within 1	12 months from the date of thi	s form?	◯ Yes ◯ No	
8. Are there any modifications that can	improve cost effectiveness?		🔿 Yes 🔿 No	
If yes, explain:				
9. Have groundwater table fluctuations	changed the contaminant leve	el trends over time?	🔿 Yes 🔿 No	
If yes, explain:	•			

10. Has the direction of groundwater flow changed during the reporting period? O Yes O No If yes, approximate change in degrees:

B. Additional Attachments

Attach the following:

- Groundwater contour map.
- Groundwater contaminant distribution map (may be combined with contour map). •
- When contaminants are aerobically biodegradable, attach a dissolved oxygen in groundwater map (dissolved oxygen may be • combined with the contaminant data on a single map).
- Graph of contaminant concentrations versus time for the contaminant listed in A.1.a. (above) for the monitoring point with the greatest level of contamination. Note: This is the minimum required graph; however, it is recommended that multiple time versus contamination
 - concentration graphs as described in the instructions on page 24 for Natural Attenuation of Groundwater be submitted.
- Graph of contaminant concentrations versus distance.
- Groundwater contaminant chemistry table.
- Groundwater biological parameters.
- Groundwater elevations table.

Remediation Site Operation, Maintenance, Monitoring & Optimization Report

Form 4400-194 (R 06/20)

gpm

Page 10 of 29

Section IS-1, Soil Venting (Including Soil Vapor Extraction, Building Venting and Bioventing) A. Soil Venting Operation

To:05/18/2022

Note: This form is not required for building vapor mitigation systems that are installed proactively to protect building occupants/users and are not considered part of ongoing active soil remediation.

1. Number of air extraction wells available and number of wells actually in use during the period:

2. Number of days of operation (only list the number of days the system actually operated, if unknown explain):

3. System utilization in percent (days of operation divided by reporting time period multiplied by 100). If < 80%, explain:

4. Average depth to groundwater:

B. Building Basement/Subslab Venting System Operation

1. Number of venting points available and number of points actually in use during the period:

2. Number of days of operation (only list the number of days the system actually operated, if unknown explain):

3. System utilization in percent (days of operation divided by reporting time period multiplied by 100). If < 80%, explain:

C. Effectiveness Evaluation

1. Average contaminant removal rate for the entire system:	pounds per day
2. Average contaminant removal rate per well or venting point.	pounds per day

- 3. If the average contaminant removal rate is less than one pound per day for the entire system, or if the average contaminant removal rate per well is less than one tenth of a pound per day, evaluate the following:
 - a. If contaminants are aerobically biodegradable and confirmation borings have not been drilled in the past year:
 - i. Oxygen levels in extracted air:

percent

ii. Methane levels in extracted air (ppm_V) If over 10 ppm_V , explain:

iii. If methane is not present above 10 ppm_V and if oxygen is greater than 20 percent in extracted air, you should either:

- Drill confirmation borings during the next reporting period, if the entire site should be considered for closure.
- Or, perform an in situ respirometry test in a zone of high contamination. Do not perform the test in an air extraction well, use a gas probe or water table well. If a zero order rate of decay based on oxygen depletion is less than 2 mg/kg per day, then you should drill confirmation borings, if the entire site should be considered for closure. If the rate of decay is between 2 and 10 mg/kg, operate for one more reporting period before evaluating further. If the zero order rate of decay is greater than 10 mg/kg total hydrocarbons, continue operating the system in a manner than maximizes aerobic biodegradation.
- b. If contaminants are not aerobically biodegradable and confirmation borings have not been recently drilled during the past year, you should drill confirmation borings during the next reporting period if the entire site should be considered for closure.
- c. If soil borings were drilled during the past year and soil contamination remains above acceptable levels, explain if the system effectiveness can be increased and/or if other options need to be considered to achieve cleanup criteria.

D. Additional Attachments

Attach the following to this form:

- Well and soil sample location map indicating all air extraction wells. If forced air injection wells are also in use, identify those wells.
- If water table monitoring wells are present at the site, a map of well locations.
- Time versus vapor phase contaminant concentration graph.
- Time versus cumulative contaminant removal graph.
- Groundwater elevations table, if water table wells are present at the site; also list screen lengths and elevations.
- Table of soil contaminant chemistry data.
- Soil gas data, if gas probes are used to monitor subsurface conditions in locations other than where air is extracted.
- System operational data table.

Remediation Site Operation, Maintenance, Monitoring & Optimization Report

Form 4400-194 (R 06/20)

Page 12 of 29

Section IS-3, Other In Situ Soil Remediation Methods

A. Effectiveness Evaluation

1. Describe the method used to remediate soil at the site:

The Bioremediation Pilot Test program is a preliminary evaluation of the efficacy of enhanced attenuation of NNOCs using periodic soil mixing with moisture and pH adjustment. The test program, initiated June 16, 2007, is currently evaluating alternate till bed configurations, mixing frequencies, and cell construction methods. Analytical data is currently being collected to evaluate the effects of soil moisture, pH and various NNOC mixtures on degradation pathways and is anticipated to provide information needed to implement a full scale program within several years.

To:05/182022

2. List all information required by the DNR for this remediation method for this site:

This form is attached to a Waste Management Progress Report, which required to support the Remediation Variance issued by WDNR for the Bioremediation PilotTest program. Methods to achieve remediation are currently not fully evaluated and will not be available until the test program is completed. Until such time, annual progress reports \will provide waste tracking data requested by the Remediation Variance for the following topics:

Product Residuals and Debris Removed from Bioremediation Pilot Cells

Movement of Impacted Soils into Bioremediation Pilot Cells

Alternative Treatment of Large Debris

Multiple pilot cells have been constructed at the site. Detailed information regarding the cells is included in the annual Waste Management Progress Report.

B. Additional Attachments

Form 4400-194 (R 06/20)

Page 17 of 29

Section INS- 1, Section by Section Instructions and Information

To:05/18/2022

Specific Section by Section Instructions for This Form. The site name and reporting period is listed on every page. Then if the pages are inadvertently separated, that information can be used to determine which pages form the report.

General Site Information

- -- A.1. List the name as it appears on the DNR tracking system. If the person filling out the form does not know what the name on the tracking system is, use the name that the DNR used in the most recent correspondence.
- -- A.2. The reporting period should be either from January 1 to June 30 or July 1 to December 31 for active systems. For passive systems, use a calendar year basis. If however the report covers a newly installed system, list the actual startup date instead of January 1 or July 1. For new passive systems, use the first date that monitoring data is available as the date of startup.
- -- A.3. Enter all regulatory agencies that regulate the site.
- -- A.4. This form is a DNR form. For that reason, list the DNR site number. If there are other agencies regulating the site, listing identification numbers for other agencies is also recommended, but not mandatory, unless specified by those other agencies.
- -- A.5. If the information listed for the site location is not sufficient information for a person to use to drive to a site (example: no street address in a rural area), also include a map that is sufficient for a person to use to drive to the site. A U.S.G.S. topographic map that shows the site location may be used.
- -- A.8. List the contaminants that have at one time exceeded the PALs or Table Values in ch. NR 720. If GRO and/or DRO exceed the ch. NR 720 standards, also list GRO and/or DRO. Do not list other contaminants that have never exceeded state standards at the site. If more room is necessary, write "SEE ATTACHED SHEETS" and list all contaminants on a separate sheet.
- -- A.9. List the predominant soil types that are contaminated. If there is both contaminated soil and groundwater at the site, list soil types both above and below the water table. If only some soil is contaminated, do not list the soil types that are uncontaminated. If the site soils meet soil cleanup criteria, but groundwater is contaminated, so state that. Specify if the USCS or USDA system is used for soil descriptions. This line specifies soil because the vast majority of contaminated sites do not have contaminated bedrock. If bedrock is contaminated, also list that bedrock type.
- -- A.10. If the groundwater meets ch. NR 140 standards, enter "NA NO NR 140 EXCEEDANCES". Otherwise, list the estimated hydraulic conductivity and the method used to estimate it (bail-down tests, calculations based on grain size, pumping test, etc.) If the hydraulic conductivity has not been determined, state when the tests are to be conducted. When a number of test results are available, list the range of results and the geometric mean. If however some results have a low level of accuracy and some results have a high level of accuracy, you should only list the most accurate results. See the Section on aquifer testing in the *Guidance on Design, Installation and Operation of Ground Water Extraction and Product Recovery Systems* for more information.
- -- A.11.If the groundwater meets ch. NR 140 standards, enter "NA NO NR 140 EXCEEDANCES". Otherwise, enter groundwater average linear velocity as a function of hydraulic conductivity, effective porosity and the groundwater gradient. You should use the geometric mean from A.11. (above) and the most representative value for the gradient at the site. Estimate the effective porosity based on soil types and geologic origin of the soil. If there are reasons to believe that the average liner velocity estimate is less than the actual rate at the site, so state that reason. Secondary porosity effects, flow through submerged utility trenches, widespread contaminant distribution in low permeability soils, etc., are reasons to assume that the actual migration rate is much greater than the predicted average linear velocity. In such cases, you should explain the reasoning for doubting the predicted average linear velocity.
- -- A.12.If the information listed for the soil treatment location is not sufficient information for a person to use to drive to a site, also include a map that is sufficient for a person to use to drive to the site. A U.S.G.S. topographic map or a plat map that shows the site location may be used.

Site name: Former DuPont Barksdale Works	
Reporting period from: 05/19/2021	To:05/18/2022
Days in period: 365	

Form 4400-194 (R 06/20)

Page 18 of 29

- -- B. Check all methods used at a site. For example, if groundwater extraction, free product recovery and soil venting are used, check all three methods and submit the additional pages for those methods. If dual-phase or bioslurping are used, these methods extract both air and groundwater, check boxes for and attach additional pages for both soil venting and pump and treat.
- -- C. Remediation systems that use any form of enhancement are considered "active" and sites where there are no enhancements of any kind are considered "passive" forms of remediation. For purposes of these forms, natural attenuation (also called naturally occurring bioremediation) is "passive" and all other remediation methods are "active" methods.
- -- C.1. Design flow rates refers to flow rates such as gallons per minute extracted by a ground water extraction system, standard cubic feet per minute extracted by a soil venting system, standard cubic feet per minute injected by an in situ air sparging system, etc. If the actual flow rate is within 80 percent of the rate predicted in the design, consider that as meeting the design specification.
- -- D. The cost data in this section is used by DNR staff to evaluate whether or not the selected remedy is the most cost effective remedy and whether or not system modifications may be warranted to improve efficiency and/or cost effectiveness. Responsible parties and consultants are encouraged to submit cost information so that DNR staff may assist responsible parties and consultants accomplish environmental cleanups in the most cost effective manner.

Total costs for past costs are all costs to date. This information is for all costs that were incurred to investigate and/ or remediate the site. These costs include but are not limited to: consulting labor and supplies, laboratory testing, transportation, equipment, etc. If the consultant does not pass all costs through the consulting firm, the consultant will need to contact their client for other non-consulting costs to determine total costs. Exceptions include costs for attorney fees, accounting, claim assistance in preparing claims to state reimbursement funds, or other indirect expenses that are not essential to remediating the site.

- -- D.2. The initial implementation costs are all costs that are incurred to start implementing a remedy at a site. Costs for the investigation however are excluded because those costs are incurred prior to remedy selection. Since costs for treatability and/or pilot testing are used to procure data for remedial design and are specific to different remediation methods, these costs should be included in implementation costs and not investigation costs. Startup or shakedown costs are also considered implementation costs and should not be considered operation and maintenance costs.
- -- D.3. Costs for implementation or investigation should not be repeated here or they will be double counted.
- -- D.4. Costs for implementation or investigation should not be repeated here or they will be double counted.
- -- D.5. Costs for implementation or investigation should not be repeated here or they will be double counted.
- -- D.6. Examples of one-time or unusual costs include the following:
 - Replacing a burned out motor on a pump.
 - Replacement of a well that was destroyed by a snowplow.
 - Confirmation sampling to determine if the site meets closeout criteria. This type of cost is considered an unusual cost because this type of sampling is not conducted during most reporting periods.
- -- D.7. This estimate of costs is for all costs to close out a site minus the salvage value of any remediation equipment. Pertinent costs include items such as well abandonment, equipment removal from the site, consulting costs associated with these items, etc. Do not include any costs that will not be paid by a state reimbursement fund, such as repaving.

Site name: Former DuPont Barksdale Works

Days in period: 365	

Form 4400-194 (R 06/20)

Page 19 of 29

Section GW-1, Groundwater Extraction and Product Recovery

- -- A.1. List two numbers, the total number of extraction wells at the site and the number that were in actual use during the period. If all wells were in use, state that on the form.
- -- A.2. The number of days of operation are the number of days that the system was actually operated. If the system was shut down for reasons such as: repairs were necessary, piping froze, shut down to provide time for subsurface conditions to equilibrate before sampling, etc., do not list those days as being in operation.
- -- A.3. System utilization is a measure of the amount of time that the system operated relative to the amount of time that it could have operated.
- -- A.5. The average is for the entire site, not per well or trench. For purposes of determining the average ground water extraction rate, calculate the average based on the total volume of groundwater extracted divided by the time of the reporting period. For example, if the system operated at 10 gallons per minute for one month, the amount of water extracted would be approximately 432,000 gallons. If the reporting period was six months long, then the time period is approximately 260,000 minutes. Therefore, the average flow rate over six months is 432,000 divided by 260,000 minutes for an average flow rate of 1.67 gallons per minute (gpm).
- -- A.6. Calculate the total dissolved contaminants removed in pounds. If the estimate is a sum of BTEX and not based on a total hydrocarbon test (GRO and/or DRO), so state that on the form.
- -- B.3. The average should be based on the entire site over the entire reporting period. See instructions above for A.5. List the free product recovery rate as gallons per day (gpd), not gallons per minute (gpm).
- -- C.1. To answer this question, a thorough evaluation of water levels and chemical analyses in all monitoring points at the site is necessary.
- -- C.2. If the capture zone has not been determined mathematically, it will need to be determined to answer this question. See the *Guidance on Design, Installation and Operation of Ground Water Extraction and Product Recovery Systems* for and any recent update or errata sheets for more information on plume capture.
- C.4. When free product is present, line C.4.a. should state "FREE PRODUCT" and lines C.4.b. through C.4.d. are left blank. Otherwise, complete the following calculations. There typically are several compounds at most contaminated sites that exceed the standards in ch. NR 140. The purpose of this question is to focus on the single contaminant that requires the most treatment to achieve groundwater quality standards on a percent reduction basis. For example, the most recent round of sampling at an example site demonstrated the highest levels of contaminants were 1,000 µg/L benzene and 1,000 µg/L toluene in the most heavily contaminated monitoring well. The ES and PAL for benzene is 5 µg/L and 0.5 µg/L (respectively) and for toluene the ES and PAL is 343 µg/L and 68.6 µg/L (ES and PAL data as of August 1995). Therefore the percent reduction to meet the ES and PAL for benzene is 99.5 and 99.95 percent and for toluene it is 65.7 and 93.14 percent. For that reason, the single contaminant that is most critical to reaching state groundwater standards is benzene. Therefore benzene is entered on line a. In this example, 99.5 and 99.95 percent is entered on line b. In this example, 1,000 µg/L is entered on line c. In this example, benzene is the driving factor, therefore enter the maximum benzene level in the single most heavily contaminated extraction well during the most recent sampling period on line d.
- -- D. See the generic discussion at the end of the instructions (below) for figures, graphs and tables, starting on page INS-2.

Section GW-2, In Situ Air Sparging

- -- B.1. See instructions for Section GW-1, Item C.4.
- -- C. See the generic discussion at the end of the instructions (below) for figures, graphs and tables, starting on page INS-2.

Site name: Former DuPont Barksdale Works

Form 4400-194 (R 06/20)

Page 20 of 29

Section GW-3, Natural Attenuation in Groundwater

- -- A.1. See instructions for Section GW-1, Item C.4.
- -- A.2.a. List the estimated hydraulic conductivity that was listed on line A.11 in Section GI-1.

:05/18/2022

- -- A.2.b. List the groundwater average linear velocity that was listed on line A.12 in Section GI-1.
- -- A.3. Assess the monitoring well network to determine if there is a down gradient well that has not been impacted by the contaminants. Consider the possibility of a submerged (or diving) plume in that assessment. If all evidence indicates that the plume does not extend to the farthest "clean" downgradient well, indicate "YES" on the form. Otherwise indicate "NO" on the form. If there are not plans to install such a well, explain.
- -- A.4. Based on the contaminant distribution, evaluate whether or not the plume is expanding, stabilized, or contracting. When making this determination, consider the contaminant that requires the greatest percent reduction to achieve ch. NR 140 standards.
- -- A.5. If the plume is expanding and a justification is necessary, add additional sheets justifying why natural attenuation is still the appropriate remedy. If it is not, further describe in the explanation the plans to use a different remedy.
- -- A.6.a. Enter the upgradient dissolved oxygen (DO) level(s). If however there are contaminants measured in the upgradient well, it is not a true background measurement. In that case enter "UNKNOWN" on the form.
- -- A.6.b. Enter the range of DO values measured in wells within the plume.
- -- B. See the generic discussion at the end of the instructions (below) for figures, graphs and tables, starting on page INS-2.

Section GW-4, Other Groundwater Remediation Methods

- -- A.1. See instructions for Section GW-1, Item C.4.
- -- A.2. Self explanatory.
- -- A.3-4. Enter the information specified by the DNR for this method at this site.

Section IS-1, Soil Venting (Including both Soil Vapor Extraction and Bioventing)

-- B.3. This subsection is used as a trigger for determining if the system requires an evaluation for future activities, such as improvements, converting the site to monitoring for natural attenuation, closure, etc. If an in situ respiration test must be performed, see Hinchee, R.E. and Ong, S.K. 1992. A Rapid In Situ Respiration Test for Measuring Aerobic Biodegradation Rates of Hydrocarbons in Soil. *Journal of the Air and Waste Management Association*. Volume 42, Number 10. Pages 1305 to 1312 for general procedures. For a discussion of methane monitoring, see the instructions for Section IS-2, item A.1.d., below. If the contaminant extraction rate in B.3. is greater than the trigger levels, leave lines B.3.a.i. and B.3.a.ii. blank.

- C. See the generic discussion at the end of the instructions (below) for figures, graphs and tables, starting on page INS-2.

Page 21 of 29

Section IS-2, Natural Attenuation in Soil

-- A.1. This data is used to assess subsurface conditions based on soil gas data. Whenever possible, a permanently installed gas probe should be used. If at all possible, the gas probe should be located in the part of the site that is most heavily contaminated, since that is the part of the site that is likely to take the longest amount of time to meet ch. NR 720 standards. Water table wells that have screen exposed above the water table are also good measuring points. When installing permanent gas probes, you should install the screen deep enough that a true measure of the most heavily contaminated soil is possible, but install the screen shallow enough to assure that it is not submerged by groundwater table fluctuations. In some situations where the depth of contamination is variable, consideration should be given to using nested gas probes instead of only using probes at a single depth. Measuring points that should not be used include temporary gas probes because these points are less repeatable from one monitoring event to the next. Also, if there has been an active soil venting system in use at the site, the air extraction wells should not be used because these wells are in locations that have had much more aggressive treatment than the rest of the site.

To:05/18/2022

- -- A.1.a. A flame ionization detector (FID) is specified instead of a photo ionization detector (PID) because PIDs often read inaccurately in moist oxygen deficient/carbon dioxide rich atmospheres. Also, PIDs do not detect some petroleum compounds.
- -- A.1.d. Methane readings are used to measure for anaerobic conditions. When the original product that is lost is a refined petroleum product (not crude oil), there should not be any methane within the product. Methane however may be produced under very anaerobic conditions. Any method may be used for measuring methane provided that the detection limit is less than a few ppm_V. One convenient method is to use an FID that is equipped with a granular activated carbon filter to filter out non-methane components. Some instrument manufacturers make these filters available as options. In some cases an FID will flame out due to an oxygen deficiency. Some instrument manufacturers offer a dilution device as an accessory that is designed to prevent flameouts and also raises the upper limit of measurement to 10,000 ppm_V or higher. If the meter "pegs" at 10,000 ppm_V (or one percent), enter ">10,000 ppm_V."
- -- A.2. The background monitoring point is predominantly used to measure natural oxygen and carbon dioxide levels in soil over time. For this reason, the background monitoring point should be reasonably close to the site, but not so close that the conditions are no longer representative. Considerable variations over time can occur, this background point should be measured during every sample event. Considerations for determining if a background point is representative include:
 - If an on-site background point has minor levels of VOCs in it due to gas phase diffusion, that is acceptable, but if the levels are high, it may not be representative of true background conditions.
 - Background oxygen and carbon dioxide levels vary with soil type and natural organic carbon content. For this reason, if at all possible, the soil types should be identical within the screened interval of all gas probes.
 - The same depths should be used for all gas probes to allow comparison from one location to the next. If the depth to water varies greatly across the site, a certain amount of confusion in the data is likely. In this case, use professional judgement to provide the best data possible at a reasonable cost.
- -- A.3. Enter this data for petroleum fuel sites. For other sites, provide the data that is most appropriate for the situation.
- -- B. Cross sections are self explanatory, see the generic discussion at the end of the instructions (below) for other attachments.

Section IS-3, Other In Situ Soil Treatment Methods

-- A.2. Enter the information specified by the DNR for this method at this site.

Section INS- 2, Figures, Graphs and Tables

When figures and graphs are specified, they should at a minimum contain the following information, or an explanation as to why the information is not necessary.

Maps. All maps should include the applicable information specified in s. NR 724.11(6), Wis. Adm. Code. In most cases, all information can be combined into a single map. There are times that a single map will have so much data that it is essentially unreadable. The consultant should use professional judgement when determining if a single map or multiple maps best portray the information necessary.

- Groundwater Contour Map Guidelines.
 - -- List groundwater elevations for each measuring point on the map.

To:05/18/2022

- -- Use the most recent data available.
- -- For water table maps, do not use data from deeper piezometers. If piezometer data is shown, use a different symbol for the piezometers than used for water table wells.
- -- If any wells are dry, indicate that on the map.
- -- If free product is present at site, shade the area where free product is estimated to be present.
- -- If groundwater is extracted with a pump and treat system, also denote plume capture zone.
- -- If in situ air sparging or soil venting is in use, specify on the map if the system was operating or shut down during the water level measurements. See the Subsection on water table maps in the *Guidance on Design, Installation and Operation of Ground Water Extraction and Product Recovery Systems* for more information on this topic.
- Groundwater Contaminant Distribution Map Guidelines.
 - -- Only contaminants that exceed the ch. NR 140 ES or PAL should be shown on the map. When contaminants are above the PAL or ES at some data points and below the PAL or ES at other data points, list the data for all locations to portray which areas of the site meet ch. NR 140 groundwater quality standards.
 - -- If a well is not sampled due to the presence of free product indicate "FREE PRODUCT" at those data points.
 - -- If more than five contaminants exceed ch. NR 140 ES, only the five contaminants that require the greatest percent reduction to achieve ch. NR 140 ES or PAL should be shown on the map.
 - -- Drawing isoconcentration lines is optional, unless specified for the site on a site specific basis.
 - -- If the contamination has crossed the property line, that property line should be clearly denoted on the map.
 - -- If in situ air sparging is used, water samples from ch. NR 141 type monitoring wells may not represent aquifer water quality as a whole. For that reason, groundwater data should be obtained from driven probes with no filter pack. If there are no driven probes and conventional ch. NR 141 monitoring wells are used, shut down the air injection system at least two weeks prior to collecting groundwater samples. See the *Guidance on Design, Installation and Operation of In Situ Air Sparging Systems* and the August 1995 update sheets for more information on this topic.
- Dissolved Oxygen Map Guidelines.
 - -- Dissolved oxygen data may be shown on the contaminant concentration graphs or on a separate graph.
 - -- Dissolved oxygen maps are optional for ground water extraction and product recovery systems.
 - -- When in situ air sparging is used, monitoring points may not represent aquifer water quality as a whole. For that reason, groundwater data should be obtained from driven probes with no filter pack. If there are no driven probes and conventional ch. NR 141 monitoring wells are used, shut down the air injection system at least two weeks prior to
 - collecting groundwater samples for DO. See the *Guidance on Design, Installation and Operation of In Situ Air Sparging Systems* and the August 1995 update sheets for more information on this topic.
- Well and Soil Sample Location Map Guidelines. Well and sample location maps for all methods should clearly indicate the location(s) of the release or the area where soil contamination historically has been highest. Also, if part of the contamination has been excavated, the pit boundaries.

The recommended documentation for each remedial method is as follows:

- -- Groundwater Extraction and Product Recovery separate well location maps should not be provided, instead the wells should be indicated on the groundwater contour and contaminant distribution maps.
- -- In Situ Air Sparging the map should indicate all air injection wells, soil venting extraction wells, and all groundwater monitoring points.

Works Reporting period from: 05/19/2021	To: <u>05/18/2022</u>	Мо
Days in period: <u>365</u>		Form

Form 4400-194 (R 06/20)

Page 24 of 29

Maps (Continued).

- -- Natural Attenuation in Groundwater separate well location maps should not be provided, instead the wells should be indicated on the groundwater contour maps.
- -- Soil Venting indicate all air extraction wells. If any gas probes are used to assess subsurface conditions in either contaminated zones or background locations, also indicate those data points with a different symbol. If soil samples have been collected recently to track progress, indicate those locations with the date of sampling noted on the map.
- -- Natural Attenuation in Soil show all monitoring points. Indicate which data points are background measuring points. If soil samples have been collected recently to track progress, indicate those locations with the date of sampling noted on the map. If the site was previously treated by soil venting, the locations of former air extraction wells should also be shown since these are areas where aggressive treatment has been applied. Also show area(s) of paved and unpaved ground surface. If pavement is significantly broken to allow significant water infiltration and air diffusion, map that area as broken pavement.

Graphs. All graphs that show time versus contaminant concentration or cumulative contaminant removal should be based on total time, not only operation time. All graphs that denote cumulative removal should use pounds of contaminant removed. Graphs should accurately show the time period(s) when the system was not operating. Plot time on the X axis, concentration or cumulative removal data on the Y axis.

- <u>Time Versus Cumulative Removal.</u> The recommended documentation for each remedial method is as follows:
 - -- Groundwater Extraction and Product Recovery separate graphs should be used for free product recovery and dissolved phase recovery. A single graph for each phase is adequate, per well graphs are only necessary when specified by the Department on a site specific basis.
 - -- In Situ Air Sparging no graph is necessary (removal data is shown on the graphs for the soil venting system).
 - -- Natural Attenuation in Groundwater no graph is necessary.
 - -- Soil Venting provide a graph of cumulative removal for total VOCs for the total system.
 - -- Natural Attenuation in Soil no graph is necessary
 - -- Ex Situ Soil Treatment Using Biopiles Provide two graphs, one showing cumulative removal of total VOCs and a second graph showing total contaminant biodegradation over time.
 - -- Ex Situ Soil Treatment Using Landspreading/Thinspreading no graphs are needed.
- <u>Time Versus Contamination Concentration Graphs.</u> Create graphs with contamination level on the y axis (semilog scale) and time on the x axis (linear scale). If free product is present, time versus contamination concentration graphs are not necessary.

The recommended documentation for each remedial method is as follows:

- -- Groundwater Extraction and Product Recovery graph the contaminant level over time for the groundwater that is extracted by the extraction system. List all compounds that exceed ch. NR 140 ES or PAL. If over five contaminants exceed ch. NR 140 ES or PAL, only list the five contaminants that exceed ch. NR 140 standards by the greatest percent.
- -- In Situ Air Sparging provide a graph for the single monitoring well that is most heavily contaminated. If over five contaminants exceed ch. NR 140 ES or PAL, only list the five contaminants that exceed ch. NR 140 standards by the greatest percent.
- -- Natural Attenuation in Groundwater provide a graph for all monitoring wells that contain any compounds that exceed ch. NR 140 standards. If over five contaminants exceed ch. NR 140 ES or PAL, only list the five contaminants that exceed ch. NR 140 standards by the greatest percent.
- Soil Venting provide a graph of contaminant concentration over time for the entire system for total VOCs. If any gas
 probes are used to assess subsurface conditions in either contaminated zones, also provide a graph with the data from
 the most heavily contaminated gas probe.
- -- Natural Attenuation in Soil provide a graph of contaminant concentration over time for total vapor phase VOCs as measured with an FID, oxygen, carbon dioxide and methane in an gas probe.
- -- Ex Situ Soil Treatment Using Biopiles no graph is necessary.
- -- Ex Situ Soil Treatment Using Landspreading/Thinspreading no graphs are needed.

Page 25 of 29

Graphs (Continued).

Graph of Contaminant Concentrations Versus Distance. If free product is present, a graph of contaminant concentrations versus distance is not necessary.

The recommended documentation for each remedial method is as follows:

- -- Groundwater Extraction and Product Recovery no graph is necessary.
- -- In Situ Air Sparging and Natural Attenuation in Groundwater plot a graph with distance (on the x axis, linear scale) and contaminant concentrations (y axis, log scale) from the upgradient measurement point to the farthest downgradient data point along the centerline of the plume. List the same contaminants as shown on the Time Versus Contaminant Concentration Graphs. Clearly show the source area on the graph. If free product has been present, label the data points that previously contained free product. For in situ air sparging, see comments above about samples collected from conventional monitoring wells with filter packs versus driven probes.

Tables. Whenever possible, data over the life of the project should be listed.

The recommended documentation for each type of table is as follows:

Groundwater Contaminant Chemistry Data.

l ist[.]

- -- Contamination levels for all contaminants that exceed ch. NR 140 standards.
- -- Dissolved oxygen levels if applicable.
- -- Other biological parameters, if applicable (nitrogen, phosphorous, manganese, sulphate, iron, dissolved methane, redox potential, pH, microbial population size, etc.). See instructions for page GW-3 for more information on these parameters. Also, list the dates the samples were collected and the standard methods used to analyze the samples.
- Groundwater Biological Parameters.

For natural attenuation in groundwater only, these measurements should be listed (if known) to provide information on biodegradation. This table is not necessary for free product extraction, groundwater extraction or in situ air sparging.

Provide a table that includes any results of tests conducted for dissolved oxygen, nitrate, manganese, iron, sulphate, methane, redox potential, heterotrophic and/or hydrocarbon degrading microorganism populations. Identify on the table if the monitoring locations are upgradient, side gradient, downgradient, or within the plume, dates of sampling, and the analytical methods used for those parameters. Include all data for the life of the project. Since some of these tests are only conducted once, or periodically - enter "NS" in the table for not sampled for any parameters that were not sampled during a particular round of sampling.

When asked to list the standard methods, list the method if a standard method exists. There are however some tests (for example dissolved methane) where there are no official standard laboratory or field methods. In this case the laboratory will have to create their own standard procedures. In these cases list the name of the laboratory and that laboratory's name for that test.

Specific considerations for each parameter are as follows:

- -- Dissolved oxygen (mg/L). The most efficient mechanism for natural or enhanced biodegradation of petroleum compounds is aerobic biodegradation.
- -- Nitrate (mg/L as N). Nitrate (NO3-1) is a potential electron acceptor for denitrification and also serves as a nutrient for heterotrophic microbial populations to enhance aerobic biodegradation. Decreasing nitrate levels from background wells to wells within the plume are an indication of either aerobic or anaerobic biodegradation.
- -- Manganese as Mn⁺² (mg/L). Manganese as Mn⁺⁴ is converted to soluble manganese as Mn⁺² under anaerobic biodegradation. For this reason, total manganese analysis is not appropriate, only soluble manganese as Mn⁺². When the levels of soluble manganese are higher in wells within the plume than in background wells, that is an indication of anaerobic biodegradation.
- Iron as Fe^{+2} (mg/L). Iron as Fe^{+3} is converted to soluble iron as Fe^{+2} under anaerobic biodegradation. For this reason, total iron analysis is not appropriate, only soluble iron as Fe⁺². When the levels of soluble iron are higher in wells within the plume than in background wells, that is an indication of anaerobic biodegradation.

Site name: Former DuPont Barksdale Works		Rei
Reporting period from: 05/19/2021	To:05/18/2022	Mo
Days in period: 365		Form

Form 4400-194 (R 06/20)

Tables (Continued).

- -- Dissolved sulphate (SO4⁻², mg/L). Sulphate (SO4⁻²) is a potential electron acceptor. Decreasing sulphate levels from background wells to wells within the plume are an indication of anaerobic biodegradation.
- -- Dissolved methane (mg/L). Methane is produced under anaerobic conditions. Since background methane levels can usually be assumed to be zero, in most cases only measurements within the plume are used. Exceptions are when the natural soils have very high levels of TOC (for example peat), background methane levels are also warranted. When the contaminant is crude oil instead of a refined petroleum product, methane measurements may however cause erratic results. Significant amounts of methane may be created when other electron acceptors (NO3⁻¹, Mn⁺⁴, Fe⁺³ and SO4⁻²) are exhausted. For this reason, significant levels of methane are indicative of very very anaerobic conditions.
- -- Redox potential (millivolts, include + or sign). Redox potential is another measure of the level of aerobic/anaerobic conditions, however it is a much more sensitive measurement than DO at very low levels of DO.
- -- Heterotrophic and hydrocarbon degrading microorganism populations (CFU/mL). Heterotrophic and specific hydrocarbon degrader population sizes should be listed for both background locations and locations within the plume, if there is information available. There is disagreement by many of the experts within the field as to the merits of sampling for this parameter. Refer to other DNR guidance documents on natural attenuation (or passive bioremediation) for more information on this topic.

Soil Gas Data.

The recommended documentation for each remedial method is as follows:

- -- When natural attenuation in soil is used, provide a graph of all soil gas readings over time for every data point.
- -- When soil venting is used, if a gas probe is used to assess subsurface conditions over time in a location where air is not extracted, provide that data in a table.
- System Operational Data.

The recommended documentation for each remedial method is as follows:

- -- Groundwater Extraction and Product Recovery:
 - Well by well flow rates in gpm for each extraction well. If a well is off line, list flow rate as "ZERO." Clearly denote on the table periods of system shutdown.
- -- In Situ Air Sparging:
 - Air pressure and injection flow rates in scfm for each well. If a well is off line, list flow rate as "ZERO." Clearly denote on the table periods of system shutdown.
- -- Natural Attenuation in Groundwater no table needed.
- -- Soil Venting:
 - Vacuum readings and extraction rates in scfm for each well. If a well is off line, list flow rate as "ZERO." Clearly denote on the table periods of system shutdown.
 - Air concentrations in ppm_V or in mg/L for total VOCs.
 - Total system contaminants removed in pounds and the pounds per day removal rate.
- -- Natural Attenuation in Soil no table needed.

Site name: Former DuPont Barksdale Wor	k
--	---

Days in period: 365

Tables (Continued). -- Ex Situ Soil Treatment Using Biopiles:

- If forced air ventilation is used: 0
 - System extraction rates in scfm.
 - Air concentrations in ppmv for total VOCs.
 - Total system contaminants removed in pounds and the pounds per day removal rate.
 - Temperature.
- If passive ventilation is used, a table of temperatures. 0
- -- Ex Situ Soil Treatment Using Landspreading/Thinspreading no table is needed.

Section INS-3, Example Calculations for Determining the Biodegradation Rate on Forced Air Biopiles

To:05/18/2022

Important Note: This page uses a nonproportional font and characters that are unique to WordPerfect. If the user received this document electronically, this page may need to be converted to a different font for the formulas to print correctly. The original font used for this page was prestige elite with 16.67 characters per inch.

Assumptions:

- The measurements at the stack are as follows:
 - -- Average flow rate is 20 scfm.
 - -- Average oxygen level extracted from biopile is 14.0 percent by volume.
 - -- Average carbon dioxide level extracted from biopile is 3.5 percent by volume or 35,000 ppmv.
- Atmospheric air contains 21 percent oxygen by volume and 400 ppm_V (or 0.04 percent) carbon dioxide. (Note: On each site visit, the consultant should check atmospheric air to assure that the instrument is spanned correctly.)
- Atmospheric air weight 0.0763 pounds per cubic foot at standard temperature and pressure (Gibbs, 1971).
- Average molecular weight of air is 28.97 (Gibbs, 1971) which is rounded off to 29, molecular weight of O₂ is 32, molecular weight of CO₂ is 44.
- For every pound of contaminants biodegraded, 3.3 pounds of oxygen is utilized and up to 3.2 pounds of carbon dioxide is generated.
 - -- The stoichiometry of aerobic benzene biodegradation can be described as follows:

C6H6 + 7.5 O2 -- -- > 6 CO2 + 3 H2O

Based on this, benzene biodegradation requires that 3.07 pounds of oxygen are utilized to fully oxidize one pound of benzene, assuming no electron acceptors other than oxygen are used. Assuming no biomass is produced and no geochemical reactions consume carbon dioxide, 3.38 pounds of carbon dioxide is generated from one pound of benzene.

-- The stoichiometry of aerobic hexane biodegradation can be described as follows:

C6H14 + 9.5 O2 -- -- > 6 CO2 + 7 H2O

Based on the above assumptions, hexane biodegradation requires 3.52 pounds of oxygen and generates up to 3.06 pounds of carbon dioxide.

Other hydrocarbons also require a similar ratio of oxygen for aerobic biodegradation. For purposes of this guidance it is assumed that a pound of petroleum contamination requires 3.3 pounds of oxygen and generates up to 3.2 pounds of carbon dioxide and 1.1 pounds of water in the biodegradation reaction.

Calculations:

Oxygen utilization rate:

Carbon dioxide production rate:

Site name: Former DuPont Barksdale Works

To:<u>05/18/2022</u>

Remediation Site Operation, Maintenance, Monitoring & Optimization Report

Form 4400-194 (R 06/20)

Page 29 of 29

Calculations (Continued):

Biodegradation rate based on oxygen:

7.07 / 3.3 = 2.1 pounds per hour

Biodegradation rate based on carbon dioxide:

4.81 / 3.2 = 1.5 pounds per hour

Since the biodegradation rate is based on oxygen utilization and/or carbon dioxide generation, it is a measure of the overall biodegradation rate of all carbon sources, including natural organic carbon and any organic materials that were added. For this reason, the biodegradation rate is not specific to hydrocarbons and it is likely that the measured biodegradation rate will overestimate the rate of contaminant reduction.

Commonly the measured biodegradation rate based on carbon dioxide generation is less than the rate estimated with oxygen. Because of geochemical interferences and biomass formation, estimates based on carbon dioxide measurements are often low. If however the biodegradation rate estimate based on carbon dioxide is significantly greater than the estimate based on oxygen, it is likely that there is a measurement or calculation error. In this way, the carbon dioxide measurements can be used to double check the oxygen measurements and calculations.

Hazardous Waste Annual Report 2021							
Facility Name	FORMER DUPONT BARKSDALE WORKS	DNR Contact	DNR Waste and Materials Management				
Facility ID	804009140	e-mail	DNRHazardousWasteReporting@wisconsin.gov				
EPA ID	WIR000133447	Telephone					

Site Details

Site Name	FORMER DUPONT BARKSDALE WORKS
Site Land Type	Private
Location Address	72315 STH 13 BARKSDALE WI,54806
Mailing Address	500 W JEFFERSON ST STE 1600 LOUISVILLE KY,40202
Owner	BRETTING DEVELOPMENT CORP 3401 LAKE PARK RD ASHLAND, WI 54806 715-682-5231
Operator	THE CHEMOURS COMPANY FC LLC 500 WEST JEFFERSON STREET, SUITE 1600 LOUISVILLE, KY 40202 Bradley.S.Nave@chemours.com 715-373-2100
HW Contact	BRADLEY NAVE 500 W JEFFERSON ST STE 1600 LOUISVILLE, KY 40202 BRADLEY.S.NAVE@CHEMOURS.COM 812-923-1136

This information has been retrieved from the Federal EPA's RCRAInfo System. If any of this information is incorrect, please update it at the RCRAInfo site or submit a RCRA 8700-12 Form. The completed RCRA 8700-12 Form should be emailed to the DNR contact listed at the top of this report.

Generator Status

Please identify the generator status of your facility at the time of this report submittal. This information will be used to update your information with US EPA via RCRAInfo and will be used to meet the notification or re-notification requirements.

- Large Quantity Generator Generates in any calendar month 1,000 kg (2,205 lbs) or more of hazardous waste. Generates in any calendar month, or accumulates at any time 1 kg (2.2 lbs) or more of acute hazardous waste. Generates in any calender month, or accumulates at any time, 100kg (220lbs) or more of acute hazardous waste spill cleanup material.
- Small Quantity Generator Generates in every calendar month less than 1,000 kg (2,205 lbs) of hazardous waste. Generates in every calender month no more than 1 Kg (2.2 lbs) of acute hazardous wastes: and no more than 100kg (220lbs) of acute hazardous waste spill cleanup material. Accumulates no more than 6,000kg (13.320 lbs) of hazardous waste. Accumulates no more than 1 Kg (2.2 Lbs) of acute hazardous waste spill clean up material.
- Very Small Quantity Generator Generates in every calendar month no more than 100 kg (220 lbs) of hazardous waste. Generate in every calender month no more than 1 kg (2.2 lbs) of acute hazardous waste and no more than 100kg (220lbs) of acute hazardous waste spill cleanup material. Accumulates at all times no more than 1,000kg(2,205 lbs) of hazardous waste. Accumulates at all times no more than 1 kg (2.2 lbs) of acute hazardous waste or 100 kg(220 lbs) of acute hazardous waste spill cleanup material.
- Non Generator No longer generates hazardous waste. Note: Select this option if this facility did not generate, and does not plan to generate, any hazardous waste this year.

Environmental Management System (EMS)

An EMS is a tool to help your organization understand its environmental impacts and systematically operate more efficiently by reducing energy usage, minimizing waste and reducing pollution. Proactively addressing environmental impacts helps your organization protect public health and Wisconsin's natural resources, find and utilize the most cost effective corrective measures and avoid costly noncompliance fees. DNR website for more EMS info: dnr.wi.gov/topic/greentier/ems.html US EPA for more EMS info: www.epa.gov/ems

Do you have a formal environmental management system (EMS)	' 🔵 Yes 💿 No
--	--------------

North American Industry Classification System (NAICS)

Enter all NAICS codes that describe your facility business processes (One code must be designated as primary) Introduction to NAICS

NAICS Code	Name	Primary
325920	EXPLOSIVES MANUFACTURING	True

Submittal Contact

A facility may have several users with reporting roles who can open, fill, save, and validate this form. The Signatory is the only person who can open, fill, save, validate, submit and sign this report.

To complete the Annual Hazardous Waste Reporting process the Signatory must be current and correct for this facility.

Your facility's current Signatory for this report: ELIZABETH BISHOP 17221 W. 17TH PLACE GOLDEN, CO elizabeth.bishop@aecom.com 303-216-2558

Signatory contact updates are requested through the DNR Switchboard System. The system will show all the people who have reporting roles for this facility (including secondary contacts who can also open, update, and save data to the report).

Updates to contact information and requests for these roles must be done by the person for whom the request is being made (individuals can request roles for themselves, and request updates to their own contact information). Any person with Switchboard access to a facility can request removal of people who are no longer associated with the facility.

Type of Regulated Waste Activity (WA)

The DNR database indicates you were a Small Quantity Generator in the report year.

Did FORMER DUPONT BARKSDALE WORKS generate hazardous	Yes	
waste?	0	

Please identify your facility generator status based on the amount your facility generated during the reporting year OR the higher generator status your facility chose to operate under for the reporting year. This information will ensure you report the correct information and is used to determine Federal reporting requirements and your state hazardous waste generator fee.

Large Quantity Generator - Generates in any calendar month 1,000 kg (2,205 lbs) or more of hazardous waste. Generates in any calendar month, or accumulates at any time 1 kg (2.2 lbs) or more of acute hazardous waste. Generates in any calender month, or accumulates at any time, 100kg (220lbs) or more of acute hazardous waste spill cleanup material.

Small Quantity Generator - Generates in every calendar month less than 1,000 kg (2,205 lbs) of hazardous waste. Generates in every calender month no more than 1 Kg (2.2 lbs) of acute hazardous wastes: and no more than 100kg (220lbs) of acute hazardous waste spill cleanup material. Accumulates no more than 6,000kg (13.320 lbs) of hazardous waste. Accumulates no more than 1 Kg (2.2 Lbs) of acute hazardous waste spill clean up material.

Very Small Quantity Generator - Generates in every calendar month no more than 100 kg (220 lbs) of hazardous waste. Generate in every calender month no more than 1 kg (2.2 lbs) of acute hazardous waste and no more than 100kg (220lbs) of acute hazardous waste spill cleanup material. Accumulates at all times no more than 1,000kg(2,205 lbs) of hazardous waste. Accumulates at all times no more than 1 kg (2.2 lbs) of acute hazardous waste or 100 kg(220 lbs) of acute hazardous waste spill cleanup material.

Short Term Generator. If "Yes", provide a detailed description of the short-term generation event in the Short Term Comment. If the event has ended, provide the end date.	No	
Short Term Comment		
Treat, Store or Dispose of Hazardous Waste	No	
When did the facility last file closure cost and long term cost estimates?		
Receives Hazardous Waste from Off-site	O Yes	No
Recycler of Hazardous Waste	◯ Yes	No
Exempt Boiler and/or Industrial Furnace	◯ Yes	No
Publicly Owned (Wastewater) Treatment Works (POTW) that accepts hazardous waste (via truck, rail, or dedicated pipe) for treatment, and complies with s. NR 670.001(3)(b)9.	◯ Yes	No
Permanent "Household and Very Small Quantity Generator Hazardous Waste Collection Facility" that ships hazardous waste off-site to a licensed or permitted hazardous waste treatment, storage or disposal facility, or to a recycling facility	⊖ Yes	No

Waste Codes for Regulated Hazardous Wastes

Please list the waste codes for all hazardous wastes handled at your site. D030, D007, D008

Additional Regulated Waste Activities

Other Waste Activities		
Transporter of Hazardous Waste	O Yes	• No
Under Ground Injection Control	◯ Yes	• No
United States Importer of Hazardous Waste	◯ Yes	No
Recognized Trader	◯ Yes	No
Importer/Exporter of Spent Lead⊡Acid Batteries (SLABs) under 40 CFR 266 Subpart G	◯ Yes	No
Universal Waste Activities		
Large Quantity Handler of Universal Waste (you accumulate 5,000 kg or more)	◯ Yes	• No
Destination Facility for Universal Waste	◯ Yes	No
Used Oil Activities		
Used Oil Transporter	◯ Yes	• No
Used Oil Processor and/or Re-refiner	◯ Yes	• No
Off-specification Used Oil Burner	◯ Yes	No
Used Oil Fuel Marketer	◯ Yes	No
Pharmaceutical Activities		
Operating under NR 666, Subchapter P for the management of hazardous waste pharmaceuticals	◯ Yes	• No
Withdrawing from operating pharmaceutical Activities NR 666, Subchapter P	◯ Yes	No
Eligible Academic Entities with Laborator withdrawing from managing laboratory ha	ies: Notific zardous w	ation for opting into or astes per NR 662 Subchapter K
Opting into or currently operating under NR 662 Subchapter K for the management of hazardous wastes in laboratories	Yes	• No
Withdrawing from NR 662 Subchapter K for the management of hazardous wastes in laboratories	◯ Yes	No

LQG Consolidation of VSQG Hazardous Waste

Are you an LQG notifying of consolidating VSQG Hazardous Waste 🔿 Yes Under the Control of the Same Person pursuant to 40 CFR 262.17(f)?

Notification of LQG Site Closure for CAA or Site

LQG Site Closure of a Central Accumulation Area (CAA) or Entire Facility

No

No

Notification of Hazardous Secondary Material (HSM) Activity

Have you notified under 40 CFR 260.42 that you are managing hazardous secondary material under 40 CFR 260.30, 40 CFR 261.4(a)(23), (24), (25), or (27)?* *IF you must notify that facility will begin managing excluded HSM or failed to notify prior to starting, facility must submit an 8700-12 form with the HSM addendum separately from this report.

No

O Yes

Reason for Notification

Facility will begin managing excluded HSM (I)

• Facility is still managing excluded HSM/renotifying as required (R)

Facility has stopped managing excluded HSM(S)

Description of Excluded HSM Activity. Please list the appropriate codes and quantities, in short tons, to describe your excluded HSM activity ONLY (do not include any information regarding your hazardous wastes). Use the Add Button to add additional lines."

Facility Code Waste Codes for Estimate Short Tons of excluded HSM to be managed annual	Actual Short Tons of excluded HSM that was managed during the most recent odd numbered year
--	---

Yes

🖲 No

Electronic Manifest Broker

Are you notifying as a person, as defined in s. NR 660.10(90) Wis. Admin. Code, electing to use the EPA electronic manifest system to obtain, complete, and transmit an electronic manifest under a contractual relationship with a hazardous waste generator? Find out more at US EPA e-Manifest data system

Regulated Waste Activity Comments

Comment

Short-term generator due to ongoing remediation pilot scale testing under a WDNR-approved Hazardous Waste Variance. Short -term event from August 18, 2021 to October 18, 2021. (1) roll-off box of hazardous soil & debris from treatment cell construction.

Waste Generation and Management (GM)

Waste Description

Bulk soil and debris with trace Dinitrotoluene		
Waste Codes]
D030 - 2,4-DINITROTOLUENE		
D007 - CHROMIUM		
D008 - LEAD		
Source Code	Management Method (only for Source Code G25)	Country Code (only for Source Code G62)

G44 - State program or voluntary c	leanup					
Form Code		Waste Minimization Code		Radioad	tive Mixed	
W301 - Contaminated soil	A - Continued this waste		initiatives to reduce quantity and/or toxicity of		No	
Quantity Unit of Measure		(UOM)	Density (only for UOM gallon, liter, or cubic yard)	Unit (or or cubic	nly for UC c yard)	0M gallon, liter,
12620	Pounds			lbs/gal		

On-site Generation and Management

Was any of this waste that was generated at this facility treated, disposed, and/or recycled on-site?

No		
Process System 1	Management Method	Quantity
Process System 2	Management Method	Quantity

Was any of this waste shipped off-site in the reporting year for treatment, disposal, or recycling?

Site 1	EPA ID	Management Method	Total Quantity Shipped
	ILD098642424	H040 - Incineration - thermal destruction other than use as a fuel	12,620.00
		(includes any preparation prior to burning)	
Site 2	EPA ID	Management Method	Total Quantity Shipped
Site 3	EPA ID	Management Method	Total Quantity Shipped
Site 4	EPA ID	Management Method	Total Quantity Shipped

Comments

Disposal of contaminated soil and debris from ongoing remediation pilot testing of nitrotoluene residuals

Fee Worksheet (FW)

A. Identified Generator Status During Report Year:	Large Quantity	
Base Fee for reported generator status		470.00
B. Amounts generated and tonnage fee exempted		
1. Total amount of hazardous waste generated at your site during the reporting year (in lbs.)		12,620.00
2. Amount(s) of waste exempted from tonnage fee. Please answer the for	ollowing:	
2a: Was any of the generated hazardous waste recovered for recycling or reuse (including hazardous wastes burned for the purpose of energy recovery)?	◯ Yes	• No
2b: Was any of the generated hazardous waste a leachate that was transported to a wastewater treatment plant or discharged directly to a sewer pipe?	◯ Yes	• No
2c: Was any of the generated hazardous waste removed from the site to repair environmental pollution?	• Yes	◯ No
Amount Removed (in lbs)		12,620.00
2d: Was any of the generated hazardous waste collected by a municipality under its household hazardous waste collection program or by a county under its agricultural chemical waste collection program?	⊖ Yes	No No
Total Exemptions		12,620.00
Net Waste (Generated minus Exemptions) (in lbs.)		0.00
Tonnage Fee Estimate		0.00
Total Fee Estimate (Base plus Tonnage)		470.00

Digital Signature Receipt

This is the electronic signature receipt. This receipt contains information about the document submitted, who signed it, when it was signed, and other technical information that may be used by the Department of Natural Resources to prove the authenticity of the document. This receipt is securely stored in the electronic signature system with the submitted document and neither the document nor this receipt can be altered. Electronic signatures are authorized under Wis. Stat. ch. 137 and have the same legal recognition as ink signatures on paper.

Pace Analytical Reports

September 10, 2021

Sharon Nordstrom AECOM 4051 Ogletown Road Newark, DE 19713 RE: Bio Pilot - Barksdale, WI

Enclosed are the analytical results for the samples received by the laboratory on 08/27/2021.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. These results are in compliance with the 2009 NELAC Standards and the appropriate agencies listed below, unless otherwise noted in the case narrative. This analytical report should be reproduced in its entirety.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

booried Esola

Jessica Esser Project Manager

CASE NARRATIVE

Sample Receipt Information:

One sample was received on 08/27/2021. Sample was received in acceptable condition.

Please see the chain of custody (COC) document at the end of this report for additional information.

Laboratory Control Samples (LCS):

The E1 footnote on sample A213411-01 indicates that there were quality control sample exceedances for 2,4,6-trinitrotoluene. The LCS recovery was above acceptable limits. Please see the quality control section of the report for more information.

Continuing Calibration Verification (CCV):

The HC footnote on sample A213411-01 indicates that there were high CCV recoveries for 2,4,6-trinitrotoluene, 2-amino-4,6-dinitrotoluene and 4-amino-2,6-dinitrotoluene. The upper control limit is 130% and the highest recoveries were 131%, 134% and 139%, respectively.

Date Sampled 08/25/2021 14:00

Notes and Definitions

- S Surrogate recovery was outside of laboratory control limits.
- M The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory control limits.
- HC Results may be biased high because of high continuing calibration verification (CCV).
- E1 Estimated value because of quality control sample exceedances.
- ND Analyte NOT DETECTED at or above the reporting limit or limit of detection (if listed).
- NR Not Reported
- dry Sample results reported on a dry weight basis. Detection limits (if listed) and reporting limits have been adjusted for the solids content. If the word 'dry' does not appear after the units, results are reported on an as-is basis.
- RPD Relative Percent Difference

Detection limits (if listed) and reporting limits have been adjusted for dilutions, if reported.

Sharon Nordstrom AECOM 4051 Ogletown Road Newark, DE 19713 RE: Bio Pilot - Barksdale, WI

Enclosed are the analytical results for the samples received by the laboratory on 10/07/2021.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. These results are in compliance with the 2009 NELAC Standards and the appropriate agencies listed below, unless otherwise noted in the case narrative. This analytical report should be reproduced in its entirety.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

booried Esola

Jessica Esser Project Manager

CASE NARRATIVE

Sample Receipt Information:

Eight samples were received on 10/07/2021. Samples were received in acceptable condition.

Please see the chain of custody (COC) document at the end of this report for additional information.

Date Sampled 10/04/2021 09:40

Notes and Definitions

- M1 Spike recoveries were not evaluated because of elevated levels of the spiked analyte in the parent sample.
- J Analyte was detected but is below the reporting limit. The concentration is estimated.
- D Data reported from a dilution
- ND Analyte NOT DETECTED at or above the reporting limit or limit of detection (if listed).
- NR Not Reported
- dry Sample results reported on a dry weight basis. Detection limits (if listed) and reporting limits have been adjusted for the solids content. If the word 'dry' does not appear after the units, results are reported on an as-is basis.
- RPD Relative Percent Difference

Detection limits (if listed) and reporting limits have been adjusted for dilutions, if reported.
