RE.: Air Quality Investigation Results, Webster Middle School, Milwaukee, Wisconsin

Dear Mr. Nehls-Lowe:

Enclosed for your review is the data package for the air quality investigation activities completed by Sigma Environmental Services, Inc. and Christensen Environmental Services at Webster Middle School located in Milwaukee, Wisconsin on July 10, 2000. The purpose of the air quality investigation is to characterize the air in several occupied and unoccupied spaces inside the school building for the presence of chlorinated volatile organic compounds (CVOCs), specifically cis-1,2-dichlorethene (DCE) and vinyl chloride that may have infiltrated the building from the impacted groundwater identified beneath the school building. With two minor modifications, the activities summarized here were conducted in accordance with the scope of work previously submitted to you on June 20, 2000 in response to your letter dated May 31, 2000.

The following sections present details of the air sampling and analysis methods, and a summary of the laboratory results. Data included with this letter consists of the following:

- A summary of the air sample locations, sampling times, and site conditions (Table 1)
- A summary of the air sample laboratory analytical results (Attachment A)
- A map of the air sample locations and direction of air movement at the day of sampling (Attachment B)
- Copies of the laboratory analytical reports from Air Toxics, LTD. (Attachment C)
- Photographs of the air sample locations (Attachment D)

*Mr. Henry Nehls-Lowe, MPH
Wisconsin Division of Health

Page 2*

- Chain-of-Custody records (Attachment E)
- Soil Boring/Geoprobe Well Construction Logs (Attachment F)

INVESTIGATION ACTIVITIES

The investigation activities were designed to comply with the Wisconsin Department of Health and Family Services request to: 1) evaluate indoor air quality, with respect to chlorinated solvent vapors, within Webster Middle School (School) and 2) evaluate subsurface soil vapor conditions at three locations outside of the school building.

Indoor Air Quality Monitoring Air quality monitoring for chlorinated solvent vapors was performed by Christensen Environmental Services in the three, unfinished ground floor areas and several selected occupied areas of the school. Background\ambient air quality conditions were also monitored on the first floor and exterior of the building.

On July 10, 2000, 17 indoor air samples (MPS 01 through MPS 17, see attached figures) from inside the school building were collected to determine if the CVOCs from the groundwater had migrated through the soil infiltrating the school building. Nine indoor air samples were collected in three unpaved, unoccupied ground floor areas and six indoor air samples were collected from five occupied areas of the school building. In addition, two outdoor air samples were collected upwind of the school building to serve as a reference. Note that two indoor air samples (MPS 08 and MPS 10) could not be completed as planned because the vacuum gauges on the flow controllers malfunctioned and samples were not analyzed.

- Evacuated six liter SUMMA™ Canisters with particulate filters and flow controllers supplied by the project laboratory (Air Toxics Ltd. in Folsom, California) were used to collect the 17 air samples. Each sample was collected over a period of approximately one hour with the air entering the canister through a critical orifice of a flow controller. Flow controllers were calibrated by the project laboratory before shipping the SUMMA™ Canisters to the project site. A vacuum gauge attached to each flow controller was used to monitor the initial and final vacuum during the sampling and to ensure that a minimum vacuum of five inches of mercury was left in the canister prior to ending the sampling. After sample collection the Summa canisters were shipped overnight to Air Toxics Ltd. in Folsom, California for analysis. The samples were analyzed by EPA Method TO-14S with gas chromatography/mass spectrophotometry instrumentation (GC/MS). Limits of detection were < 1 ppbv (parts per billion volume).
- The air sample locations inside Webster Middle School and the numbers and types of samples at each location are summarized in Table 1. Note that three of the indoor air

Page 3*

samples (MPS 03, MPS 05 and MPS 13, one from each unoccupied, unfinished area) were analyzed and a preliminary laboratory report of the results was submitted within 48 hours of the investigation. Maps of the sample locations are attached (Attachment A).

- Before the sampling period, the two primary HVAC systems servicing the school building had been turned off for over 60 hours. For 29 hours prior to turning the HVAC systems off, the building was supplied with 100% outdoor air for dilution ventilation. The dilution ventilation was supplied in order to dilute, as much as practical, the volatile organic compounds that may have been present in the building from previous painting (using Devoe Coatings alkyd gloss enamel paint) and cleaning operations (using San-A-Car 105 floor stripping product, floor wax, and various detergents) performed during July 5 and 6, 2000.
- A slight negative pressure was present in the school building causing the air movement from unoccupied spaces to move toward the occupied spaces of the school building as verified with ventilation smoke tubes.
- Eighty bags, barrels, and buckets of thermoplastic pellets which may contain CVOCS were stored inside the school building in area UF6. Thermoplastic pellets included GE Valox, PMS Consolidated PM5, Dow Tyron, Allied Chemical Capron, TPR Thermorubber, Cycolax, and Ferro products.
- Ground level air samples were collected at one to two feet off the floor. Breathing zone air samples were collected at 4 ½ to 5 ½ feet off the floor. The ceiling plenum air sample was collected at eight to nine feet off the floor and above the false ceiling.
- Weather conditions at Mitchell International on July 10, 2000 were: 1) 6 am-thunderstorms, rain, temperatures in the 70's, west winds at 7 mph, barometric pressure rising at 29.83 and relative humidity of 92%; and 2) 11am-clear skies, temperatures in the 70's, south winds at 6 mph, barometric pressure falling at 29.85, and relative humidity of 90%. Winds at the Webster Middle School were from the north to northeast during the sampling period, temperatures were in the 70's and the relative humidity was 98%. Temperature and relative humidity were measured during the survey using a Solomat Model 500E meter.

Subsurface Vapor Study. A subsurface soil vapor study was performed to determine the potential for the generation and migration of vapors from the dissolved phase in the groundwater to the vapor phase in the underlying unsaturated soils. Sigma installed three 1.5-inch diameter permanent soil vapor probes along the north, west, and southern sides of the School (MPS VP-1, MPS VP-2 and MPS VP-3, adjacent to the unfinished areas UF 6, UF 1 and UF 44, respectively, Figure 1). The vapor probes were installed using the GeoProbe™ soil boring method with one soil gas sample collected at each location from a depth interval of eight to twelve feet below ground surface. Prior to installation of the gas probes, each well screen was decontaminated at the Sigma facility using Hexane, followed by a triple rinse with deionized water, and packed in aluminum foil for field installation. Each of the soil gas probes was finished as a permanent well and completed within a well flush mount. Similar to indoor air sampling, the soil vapor samples were collected in a laboratory supplied SUMMA™ Canister and submitted for laboratory analysis of volatile organic compounds using EPA Method TO14S.

Laboratory Analytical Results The project was coordinated with Milwaukee Public Schools representatives and implemented with the help of Wisconsin Division of Public Health officials. Three of the indoor air samples (MPS 03, MPS 05 and MPS 13, one from each unoccupied area) were analyzed within 48 hours of the investigation and the remaining 17 air samples were analyzed within two weeks of the on-site sampling activities.

The following is a summary of the results of the laboratory analyses:

- Cis-1,2-dichloroethene (DCE) was detected in 8 of 9 air samples collected in 3 unpaved, unoccupied areas of the school at concentrations ranging from 0.17 to 5.0 parts per billion (ppb). DCE was detected in 4 of 6 air samples collected in 5 occupied areas of the school at concentrations ranging from 0.20 to 2.0 ppb. DCE was not detected in the outdoor air at concentrations above the method detection limit (MDL) of the analytical method (<0.16 ppb).
- Vinyl chloride was not detected above the MDL in the 15 indoor air samples or the 2 outdoor air samples (<0.16 ppb).
- Methylene chloride was detected in 7 of 9 air samples collected in 3 unpaved, unoccupied areas of the school at concentrations ranging from 0.18 to 0.41 ppb. Methylene chloride was detected in 6 of 6 air samples collected in 5 occupied areas of the school at concentrations ranging from 0.30 to 1.6 ppb. Methylene chloride was also detected in the outdoor air at 0.28 and 0.38 ppb.
- Trans-1,2-Dichloroethene was not detected in any air samples collected in 3 unpaved, unoccupied areas of the school at concentrations above the MDL. Trans-1,2-Dichloroethene was detected in 1 of 5 air samples collected in occupied areas of the school at a concentration of 0.32 ppb. Trans-1,2-Dichloroethene was not detected in the 2 outdoor air samples.

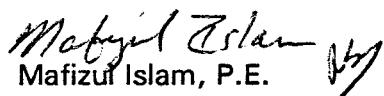

Mr. Henry Nehls-Lowe, MPH
Wisconsin Division of Health
August 7, 2000
Page 7

- Chloroform was not detected above the MDL in the 15 indoor air samples or the 2 outdoor air samples (<0.16 ppb).
- 1,1-Dichloroethane was not detected above the MDL in the 15 indoor air samples or the 2 outdoor air samples (<0.16 ppb)
- Laboratory analysis of the three soil vapor samples collected from three geoprobe wells indicate the presence of relatively high concentrations of hexane (between 210 ppm and 60,000 ppm). Two of the soil vapor samples also contained methylene chloride (between 3.4 ppm and 1700 ppm), and one sample contained 2-propanol at 6 ppm. Because of the presence of the relatively high concentrations of hexane in the vapor samples, dilution of the samples were necessary and consequently the detection limits for all the constituents were elevated. No target CVOCs were detected at concentrations greater than elevated detection limits. It is evident that during the decontamination process the cleaning solvent (Hexane) used to decontaminate the well screen remained in the screen material after the triple rinse with deionized water. Therefore, the results of the subsurface soil vapor study do not provide low level detection analyses information regarding the subsurface vapor conditions beneath the school building.

Please do not hesitate to call if you have any questions about this report or comments on the above.

Sincerely,

LABORATORY NARRATIVE
TO-14 Low Level
Christensen Environmental Services
Workorder# 0007117B

Fourteen 6 Liter Summa Canister samples were received on July 11, 2000. The laboratory performed analysis via EPA Method TO-14 using GC/MS in the full scan mode. The method involves concentrating up to 0.5 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis. See the data sheets for the reporting limits for each compound.

During the five point calibration, two low-level standards are used. The low-level standard for TO-14 compounds is spiked at 0.1 ppbv and represents the reporting limit for these compounds. The low-level standard for the non-TO-14 compounds is spiked at 0.5 ppbv and represents the reporting limit for these compounds. The TO-14 compounds are present in both standards but are excluded from reporting in the 0.5 ppbv standard since a lower level is already included in the curve.

Method modifications taken to run those samples include:

Requirement	TO-14 Low Level	ATL Modifications
Sampling/concentrator system	Nafion Drier	Multisorbent concentrator
Canister cleaning - clean air supply	Cryogenic Trap	Use of Humidified UHP Air
Canister certification	Pressurize w/humidified zero air	Pressurize w/dry UHP nitrogen
Sample load volume	400 mL	Up to 0.5 liter
Blank	Humid air blank	Humid air blank for standard analysis. Dry air blank for low level analysis.
Blank acceptance criteria	< DL	< DL
BFB absolute abundance criteria	Within 10% of that from previous day.	CCV surrogate recoveries demonstrate stability from one day to the next
BFB acceptance criteria	SW-846 Protocol	SW-846 protocol
Concentration of IS spike	Not specified	10 ppbv
Dilutions for initial calibration	Dynamic dilutions or static using canisters.	Syringe dilutions
Flow rates/operating parameters	Not specified	Optimized. See procedures section.
ICAL RRF %RSD acceptance criteria	Not specified	30% or less for standard compounds, 40% or less for non-standard and polar compounds
IS recoveries	Within 40% of mean over ICAL for blanks, and w/in 40% of daily CCV for samples.	Within 40% of CCV recoveries for blank and samples.
IS RTs	Within .33 min from most recent calibration (either ICAL or daily)	Within 0.5 min of RT in daily CCV
Daily CCV	70 - 130%	Standard compounds: 70 - 130% for at least 90%; Non-standard and polar compounds: 60 - 140% for at least 80%
RF for quantitation	From daily CCV	From ICAL

<i>Requirement</i>	<i>TO-14 Low Level</i>	<i>ATL Modifications</i>
Canister leak check	24 hour, positive pressure	20 min, vacuum check
MSD scan range	35 - 300 amu	35 - 350 amu

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

N - The identification is based on presumptive evidence.

LABORATORY NARRATIVE
TO-14 Low Level
Sigma Environmental
Workorder# 0007120

Three 6 Liter Summa Canister samples were received on July 11, 2000. The laboratory performed analysis via EPA Method TO-14 using GC/MS in the full scan mode. The method involves concentrating up to 0.5 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis. See the data sheets for the reporting limits for each compound.

During the five point calibration, two low-level standards are used. The low-level standard for TO-14 compounds is spiked at 0.1 ppbv and represents the reporting limit for these compounds. The low-level standard for the non-TO-14 compounds is spiked at 0.5 ppbv and represents the reporting limit for these compounds. The TO-14 compounds are present in both standards but are excluded from reporting in the 0.5 ppbv standard since a lower level is already included in the curve.

Method modifications taken to run these samples include:

Requirement	TO-14 Low Level	ATL Modifications
Sampling/concentrator system	Nafion Drier	Multisorbent concentrator
Canister cleaning - clean air supply	Cryogenic Trap	Use of Humidified UHP Air
Canister certification	Pressurize w/humidified zero air	Pressurize w/dry UHP nitrogen
Sample load volume	400 mL	Up to 0.5 liter
Blank	Humid air blank	Humid air blank for standard analysis. Dry air blank for low level analysis.
Blank acceptance criteria	< DL	< DL
BFB absolute abundance criteria	Within 10% of that from previous day.	CCV surrogate recoveries demonstrate stability from one day to the next.
BFB acceptance criteria	SW-846 Protocol	SW-846 protocol
Concentration of IS spike	Not specified	10 ppbv
Dilutions for initial calibration	Dynamic dilutions or static using canisters.	Syringe dilutions
Flow rates/operating parameters	Not specified	Optimized. See procedures section.
ICAL RRF %RSD acceptance criteria	Not specified	30% or less for standard compounds, 40% or less for non-standard and polar compounds
IS recoveries	Within 40% of mean over ICAL for blanks, and w/in 40% of daily CCV for samples.	Within 40% of CCV recoveries for blank and samples.
IS RTs	Within .33 min from most recent calibration (either ICAL or daily)	Within 0.5 min of RT in daily CCV
Daily CCV	70 - 130%	Standard compounds: 70 - 130% for at least 90%; Non-standard and polar compounds: 60 - 140% for at least 80%
RF for quantitation	From daily CCV	From ICAL

<i>Requirement</i>	<i>TO-14 Low Level</i>	<i>ATL Modifications</i>
Canister leak check	24 hour, positive pressure	20 min, vacuum check
MSD scan range	35 - 300 amu	35 - 350 amu

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Hexane is "E" flagged in sample MPS-VPI.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

N - The identification is based on presumptive evidence.
