Subject: Follow-Up Assessment / Remediation at a Spill Site in the Village of Theinsville - February 14, 1991 Spill

You asked that I assess the following about the spill that occurred in the Village of Thiensville:

How serious is the threat compared to other on-going cleanup projects that I am aware of?

- What immediate remedial action(s) would I recommend?
- Suggest a Remedial Action Team / Approach to address the situation.

Site Visit

John Feeney and I visited the site on 2/19/91 at about 9 a.m. and met with The spill area was approximately 47 X 10 feet Thiensville D.P.W. staff. and occurred because vandals tipped over four - 55 gallon drums and opened Approximately 15 additional drums were at the site. Kleen collected samples from the drums and the spill area to properly characterize the materials. Disposal/recycling alternatives will be based on the analytical/waste characterization. Overpack drums were already on site on 2/19/91. According to Thiensville D.P.W. and Safety Kleen the drums were to have been overpacked on Wednesday, 2/20/91. The spill area is to be excavated today, 2/21/91, and the backhoe for excavation arrived while we were at the site. Environmental Services has been contracted by the Village to oversee the excavation.

Our maximum PID reading on a sample of the spilled material was 17 ppm. It should be noted that the sample was not fully warmed at the time of the reading.

According to Jeffrey Roche of Safety Kleen, he has applied for the proper EPA identification numbers for the Village of Thiensville and expects to receive the numbers within 3 to 4 weeks.

In the past, the site was used by the Thiensville Fire Department for practice. When the new village administrator learned of the drums of dirty gasoline and waste oil, a decision was made to contract to properly dispose of the drums. Unfortunately, in the interim this spill occurred.

According to the constructor's report for the closest well which is located about 800 feet from the spill site, the depth to bedrock at the site is roughly 60 feet. There are clayey soils at the surface. Fortunately, the ground was still frozen at depth at the time of the spill and vertical migration should be minimal at the site. Site topography is flat and potential for runoff to surface water bodies (man-made pond, Pigeon Creek, and the Milwaukee River) is very low.

While on site photographs were taken; copies of these photos will be forwarded to the case investigator as soon as they are developed.

Conclusions/Recommendations

- A) The immediate remedial actions occurring at the site are satisfactory.
- B) I suggest that John Feeney be assigned to the site and that the following remedial approach be taken:
 - 1) Obtain copies of all analytical results from the waste characterization.
 - 2) Samples should be collected from the bottom and sidewalls of the excavation of the spill area. The samples should be submitted for waste characterization/contaminant identification.
 - 3) The spill area should be over-excavated to minimize the potential for contaminant migration to groundwater when spring thaw occurs.
 - 4) Depending on the analytical results, all wastes should be properly disposed of or recycled.
 - 5) Also dependent on the analytical results, additional work may be required such as borings, monitoring wells, and additional remedial action.
 - 6) A report of investigation containing all documentation should be required from the Village of Thiensville.
 - 7) John Feeney should consult with appropriate Hazardous Waste staff to assure compliance with their requirements.
- C) The threat from the site cannot be fully assessed until analytical results have been received. Mitigative actions are being taken to reduce the threat to the environment.
- c: Greg Pilarski Frank Schultz Jim Schmidt WS/2

SUBJECT:

Follow-Up Assessment/Remediation at a Spill Site.

The attached report/file documents our clean-up efforts to date at this spill site. Further remediation may be needed to adequately protect the environment. I would like you to assess this situation with the information at hand and brief me on the following issues.

1. Does this situation still pose a threat to the environment?

- How serious is this threat compared to other on-going clean-up projects that you are aware of?
- What further sampling information would you recommend?
 - What immediate remedial action(s) would you recommend?

I need your comments within five (5) working days of the date of this memo.
