Hi Haillie,

Lisa Gutknecht gave me your contact information and said that you were the new project manager for the Dun-Rite Cleaners investigation site. Greetings, I am the lead scientist and project manager working on the project on behalf of Ron Hanson/Dun-Rite Cleaners.

We recently collected ambient air and sub-slab vapor samples from buildings at and near the property. The attached two pdf files are copies of letters that were sent to the owners of buildings from which sub-slab and ambient air samples were collected.

Several of the most recent samples had higher concentrations of several VOCs than had been detected previously, and the TCE concentration in the ambient air sample from the residence exceeded its action level. I contacted the lab requesting they check their QA/QC data from those samples, and they indicated that contaminant carry-over was a possibility (see attached Word document).

As a check on the data, we have scheduled to resample the two residential samples early next week.

Also, we recently collected soil and groundwater samples from the site and areas downgradient and I expect to send those results to you in the near future. Afterwards, I'd like to arrange a meeting with you to discuss the project history, status, and path forward. I can be available to meet at your office.

I will call you after the latest Geoprobe results are reviewed and summarized. If you have any questions/comments before then, feel free to call (715-824-5969) or email me (pete.arntsen@sand-creek.com).

Looking forward to working with you,

Pete

Regards,

Pete Arntsen, M.S., P.H., Project Manager/Sr. Hydrologist

Data Review: Sand Creek
Pace Project #10321901

A data review was requested for Pace Analytical project 10321901. The client has requested a review of chlorinated compounds, benzene and naphthalene on samples 10321901007 and 10321901008. In order to facilitate the data review, the following items were reviewed for both samples:

- Sample Canister History
- Sample Flow Controller History
- Review of sample delivery group for contamination or carryover
- Review of previous sample delivery group for contamination
- Review of analytical instrument for trends or contamination

In regards to results for benzene and naphthalene, there are no discrepancies to report. Both samples had clean canister and flow controller history. A review of the sample delivery groups (both previous and the group containing these samples) did not show elevated results for benzene or naphthalene that would indicate a contamination or carryover event. Lastly, the analytical instrument was evaluated for contamination or carryover with no issues to report.

Additionally, the chlorinated results were reviewed, with specific emphasis on trichloroethene (TCE).

A review of the canister history for sample 10321901008 showed high levels of TCE in the previous sampling round. There is a possibility that the canister did not fully clean to below the reporting limit during the cleaning process. This canister was part of a batch certification, so official confirmation is not available.

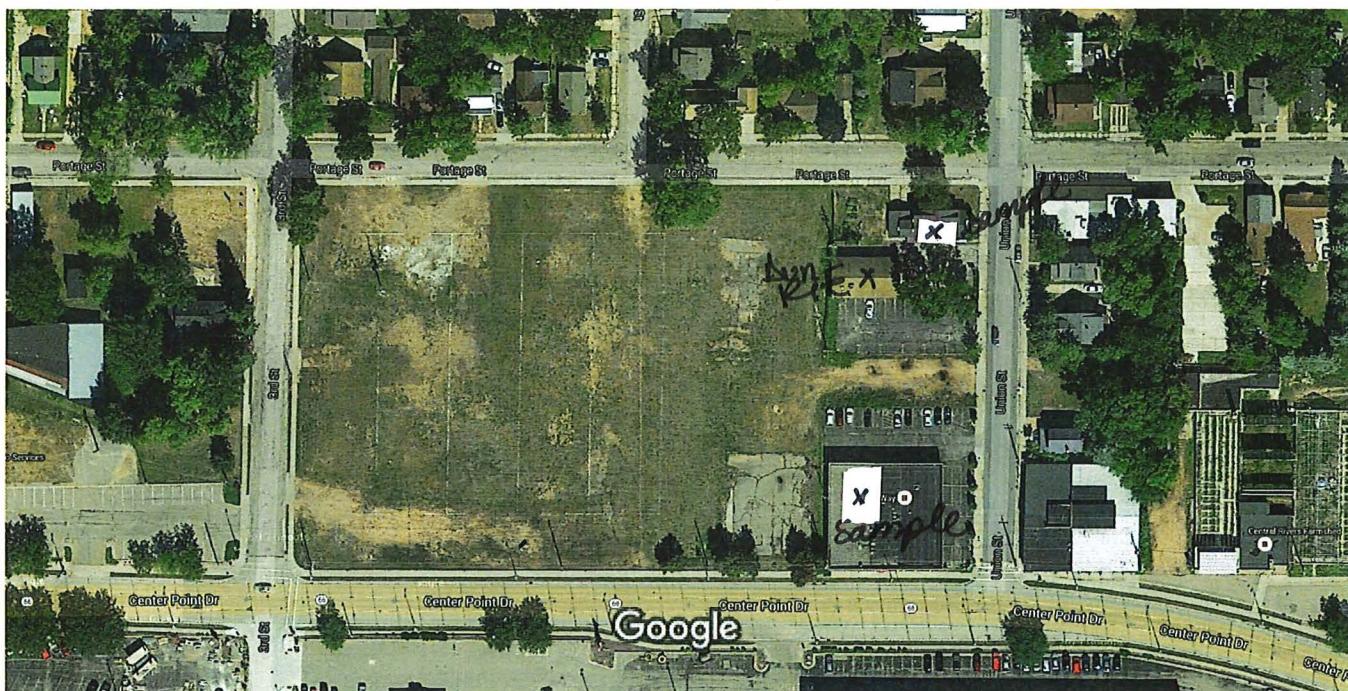

Sample 10321901007 was also reviewed. There are previous samples in this sample delivery group that have elevated levels of TCE, as well as other samples analyzed on this run day with high levels of TCE. It should be noted that the majority of these samples come from the same initial project (10321901). There is a possibility that sample 10321907007 had some small carryover or contamination from other samples in this project.

Subject: Vapor Samples Results

Dear Mr. Guzman:

The purpose of this letter is to present the results of vapor samples collected at the Guzman office building, located at 1100 Center Point Drive, Stevens Point, Wisconsin, on September 4, 2015. The samples were collected as part of environmental investigations associated with the Dun-Rite Cleaners site. The investigation is focused on chlorinated volatile organic compounds (VOCs), specifically tetrachloroethene (PCE) and trichloroethene (TCE).

Work Performed

Vapor samples were collected from four locations inside the building and one location outside the building. The four indoor samples included three samples of ambient air (i.e., typical room air) and one sample of sub-slab vapors (i.e., the vapor in the soils beneath the building). The outdoor sample was also ambient air and provides information regarding background concentrations. The samples were submitted to a laboratory and analyzed for VOCs.

Sample Results

The PCE and TCE results for all samples collected from the office building are presented on the enclosed table. All results for the most recent samples are included on the enclosed laboratory report.

Ambient Air

The three indoor ambient air samples each had detections of PCE and TCE, but all concentrations were below Action Levels. The Action Levels were established to be protective of human health, thus the concentrations are not considered to pose a health hazard.

Note that the "Attorney" sample was collected from the hallway outside the office because we were unable to coordinate a sampling time when the room was open.

Sub-Slab Vapor

The sub-slab vapor sample had a detection of PCE above its Screening Level. The occurrence is not considered a direct health threat, but it presents a concern for vapor intrusion. The Wildcard sub-slab sample was unusually high. We contacted the laboratory (which also supplies the canisters used for air sampling). We learned that a canister used for another sub-slab sample "showed high levels of TCE in the previous sampling round." The lab further advised, "There is a possibility that the canister did not fully clean to below the reporting limit during the cleaning process. This canister was part of a batch certification, so official confirmation is not available." It is as yet unclear if a similar uncertainty applies to the Wildcard sample; however, we are skeptical of this result, and will do additional testing at an appropriate time in the future.

Note that a sub-slab sample was not collected from the "Attorney" location because access was not available.

Going Forward

We anticipate continuing to collect samples of the office building ambient air and sub-slab vapors on a periodic basis. The next event is tentatively scheduled for next February. We will contact and coordinate with you beforehand to collect additional samples.

If you have any questions or concerns, please contact me via phone at 715.824.5169 or by email at pete.arntsen@sand-creek.com.

Sincerely,

SAND CREEK CONSULTANTS, INC.

Pete Arntsen, MS, PH
Project Manager/Senior Hydrologist

Re: **Dun-Rite Cleaners**
1008 Union Street
Stevens Point, Wisconsin
WDNR BRRTS No. 0250000577

Subject: Vapor Samples Results

Dear Ms. Cozzolino:

The purpose of this letter is to present the results of vapor samples collected from the residence located at 1000 Union Street on September 4, 2015. The samples were collected as part of environmental investigations associated with the Dun-Rite Cleaners site. The investigation is focused on chlorinated volatile organic compounds (VOCs), specifically tetrachloroethene (PCE) and trichloroethene (TCE).

Work Performed

As with the previous sampling events, two vapor samples were collected from the basement of the building: one of the ambient air (i.e., typical room air) and another of the soil vapors beneath the basement floor. The samples were submitted to a laboratory and analyzed for a suite of 61 VOCs.

Sample Results

The results from the three rounds of samples are summarized on the enclosed table. The laboratory report for the most recent samples is also enclosed.

The most recent results show PCE and TCE beneath the basement floor at concentrations of 137 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) and 21.4 $\mu\text{g}/\text{m}^3$, respectively. The Wisconsin Department of Natural Resources (WDNR) screening levels beneath the floor are 1,399 $\mu\text{g}/\text{m}^3$ and 70 $\mu\text{g}/\text{m}^3$.

The PCE and TCE concentrations in the most recent basement air samples were 22 $\mu\text{g}/\text{m}^3$ and 3.0 $\mu\text{g}/\text{m}^3$. The WDNR's indoor air action levels are 42 $\mu\text{g}/\text{m}^3$ and 2.1 $\mu\text{g}/\text{m}^3$.

In addition to PCE and TCE, the analysis results show detections of other VOCs, some at concentrations above screening or action levels. These substances are not associated with the Dun-Rite site and are likely due to trace amounts of chemical vapors from products (paints, adhesives, fragrances, etc.) commonly found in homes.

October 2015

The WDNR action levels for PCE/TCE are set to provide threshold concentrations for the substances that are protective of human health over long-term exposure. It is the experience of WDNR and the Wisconsin Department of Health Services (DHS) in investigating similar cases at other locations in the state that the potential health risk for the residents is low. The vapor levels measured in the indoor air at the residence present a potential long-term risk, not an immediate one.

Even though the potential health risks are low, residents who may have questions may contact Ryan Wozniak (608.267.3227) with the DHS, who can address any health questions and concerns. For additional information regarding vapor intrusion concerns, a WDNR handout is enclosed.

Going Forward

The VOC concentrations both beneath the basement floor and in the ambient air are higher than the concentrations detected during the previous two rounds. The reason for the change in concentrations is unclear. A soil vapor extraction system has been operating at Dun-Rite since last March. VOC's and other chemicals were used historically at the Lullabye property to the west of your building, and the current owner (the City of Stevens Point) has been doing additional remedial work. As a check on the September sampling results, we would like to collect another round of samples from the basement as soon as is convenient.

As with previous sampling occasions, we will contact you and coordinate sample collection.

If you have any questions or comments, please contact me via phone at 715.824.5169 or by email at pete.arntsen@sand-creek.com.

Sincerely,

SAND CREEK CONSULTANTS, INC.

Pete Arntsen, MS, PH

Understanding Chemical Vapor Intrusion Testing Results

PUB-RR-977

Apr 2014

From the Lab to You

Chemical vapor samples were taken from underneath your house or building and possibly indoors as well. These samples have been tested by a certified laboratory and a report was issued. The Wisconsin Department of Natural Resources (DNR) uses these test results to determine if people in the building are being exposed to chemical vapors coming from nearby contaminated soil or groundwater, and to decide what, if any, action is needed to prevent this exposure.

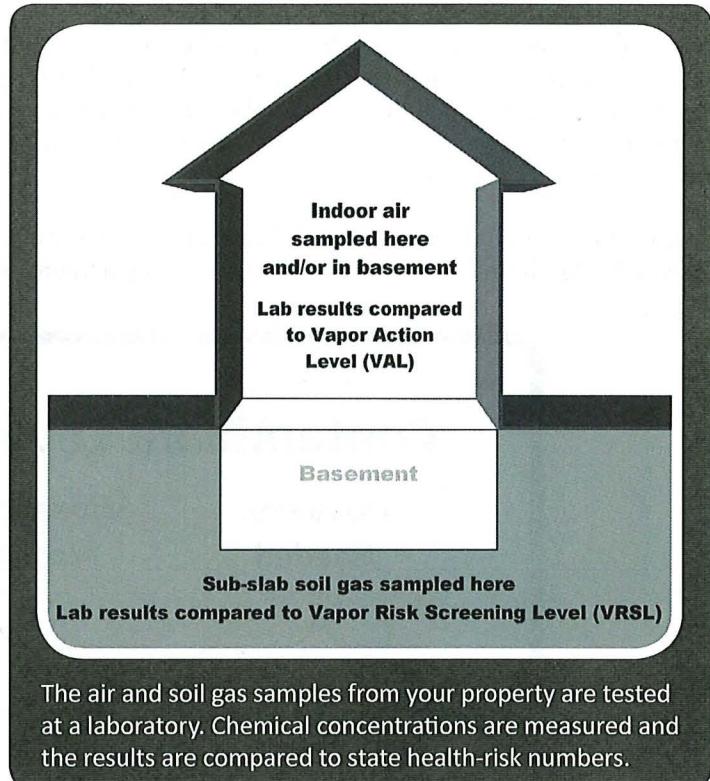

Indoor Air Testing Results

If indoor air samples were collected in your house or building, test results from the lab will be compared to the state Vapor Action Level (VAL) for chemicals of concern. If test results show chemical concentrations in your air below the VAL then adverse health effects are not expected, even if you were to breathe the chemical at this concentration for your whole life.

Test results showing chemical concentrations in the air at or above the VAL prompt DNR to recommend that exposures to these chemical vapors be reduced. If test results show concentrations significantly above the VAL, or more than one type of chemical vapor is identified in your indoor air, the risk from exposure increases. If the concentration of any indoor chemical vapor exceeds 10 times the VAL, DNR is concerned about even short-term exposure and will typically require immediate action to address the problem.

The VAL for each chemical is set by scientific research. It is protective of all people, including those who are most susceptible to adverse health effects. For cancer-causing chemicals, no more than 1 in 100,000 people breathing indoor air with chemical concentrations below the VAL are expected to get cancer from exposure to that chemical. Concentrations above the VAL are of greater concern.

If test results identify chemicals in your air that are not present in nearby soil or groundwater contamination, it is likely that these vapors are coming from some product or activity in or near your house or building. Many everyday consumer products (e.g., cleaners, solvents, polish, adhesives, lubricants, aerosols, insect repellants, etc.); combustion processes (e.g., smoking, home heating); fuels in attached garages; dry cleaned clothing or draperies; and occupant activities (e.g., craft hobbies), also release chemical vapors into the air.

The air and soil gas samples from your property are tested at a laboratory. Chemical concentrations are measured and the results are compared to state health-risk numbers.

Sub-slab Soil Gas Testing Results

Soil gas samples were collected from the ground beneath the concrete slab of your building foundation or basement. The lab measured the concentrations of various chemicals in these samples. DNR compares these measurements to the state Vapor Risk Screening Level (VRSL), which identifies the concentration of a chemical in soil gas that scientific research suggests can be a health risk if vapor enters a building. If soil gas measurements exceed the VRSL for a chemical of concern, action to reduce exposure is strongly recommended.

The VRSL is a higher number (higher chemical concentration) than the VAL because it is presumed that concrete building foundations and basement walls will prevent most soil gas from entering a building. Further, any soil gas that does enter a building through cracks, holes, sump pumps, drains, etc., will be diluted to some extent by the indoor air. So, people inside will not be breathing air that includes the full concentration of chemical vapors that exist in the ground.

Wisconsin Department of Natural Resources
P.O. Box 7921, Madison, WI 53707
dnr.wi.gov, search "Brownfields"

DNR generally relies on the test results of the sub-slab soil gas samples when determining what, if any, action should be taken related to chemical vapors coming from nearby soil or groundwater contamination. Indoor air quality is highly variable, and it is difficult to make a definitive decision about vapor intrusion based on indoor air sampling alone.

Follow-Up Actions

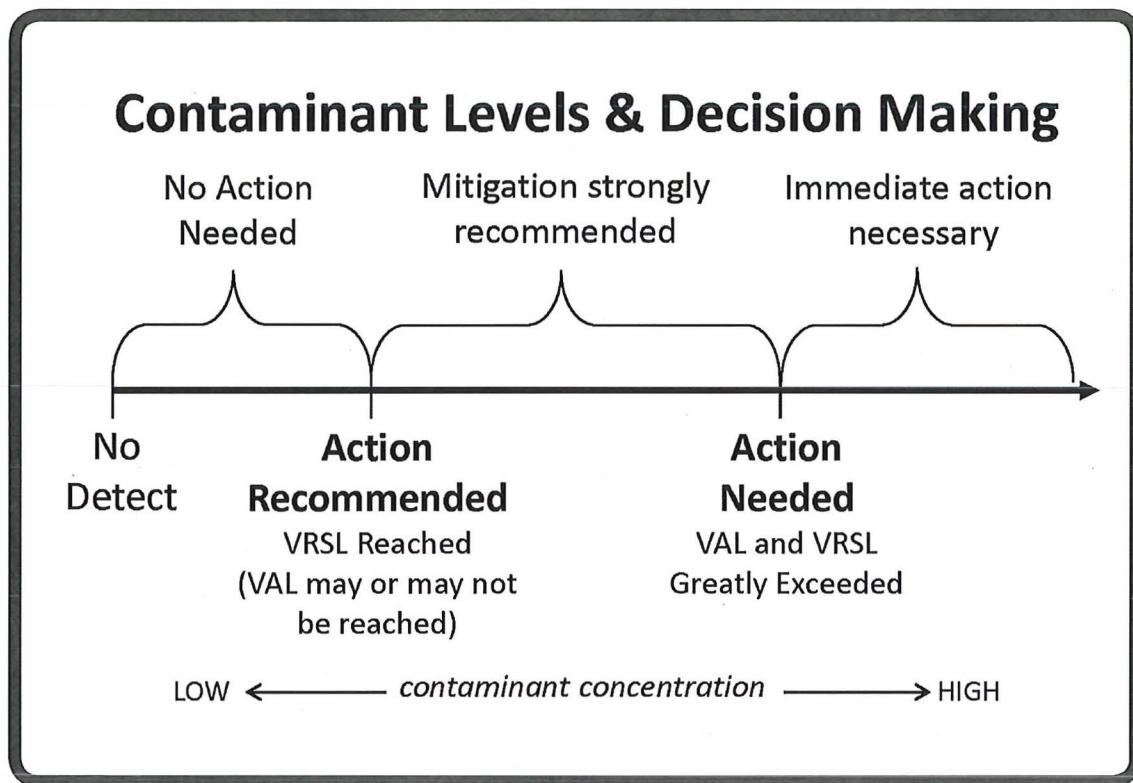

If your test results are less than a VAL for indoor air, or a VRSL for sub-slab soil gas, then the air in the house or building should not present a health concern. Follow-up sampling and testing may be necessary to confirm the results, but no other action is typically suggested.

When test results show soil gas chemical concentrations above a VRSL, both DNR and the Wisconsin Department of

Health Services recommend that owners take action to reduce potential exposure. This typically involves installing a vapor mitigation system that vents chemical vapors from beneath your home or building to the outdoors, similar to a radon mitigation system.

If indoor air concentrations exceed a VAL, but sub-slab concentrations are less than a VRSL, then the chemical vapors are most likely coming from indoor sources. Steps should be taken by the house or building owner to identify the products and practices causing the problem and implement appropriate remedies.

If soil gas mitigation is recommended, a representative of the party who is responsible for the soil or groundwater contamination will contact you to discuss your options.

A Note about Measurement Units: The lab report may include some unfamiliar technical language. The most important point to note is whether or not the test result for a specific chemical exceeds a VAL or VRSL, which are also sometimes referred to, generically, as "screening levels."

The concentration of gaseous pollutants in air is typically described in two different ways: 1) as units of mass per volume, where $\mu\text{g}/\text{m}^3$ represents micrograms of gaseous pollutant per cubic meter of ambient air; and 2) as parts per billion by volume (ppbv), where the volume of a gaseous pollutant is compared to a set volume of ambient air. These are the numbers that are compared to the VAL and VRSL.
