Subject: 2006 Annual Status Report - Lactate Injection System
Tecumseh Power Company
Grafton, Wisconsin (WDNR FID #24009170, BRRTS #02-46000751)

Dear Mr. Feeney:

This letter documents the lactate injection and associated groundwater and soil monitoring that occurred between May 2006 and August 2006 at the Tecumseh Power Company in Grafton, Wisconsin (Tecumseh). This letter includes a discussion of the lactate injection and monitoring event, a summary of the monitoring results, and our conclusions and recommendations based on the monitoring results.

Background

RMT conducted a series of site investigations at Tecumseh between 1994 and 1996, and the results of the investigations are summarized in the Subsurface Investigation Report (RMT, 1997). In general, the results of the investigations indicated that the West Dock and Recycling Dock Areas at the Tecumseh facility were potential sources for trichloroethylene (TCE) and 1,1,1-trichloroethane (TCA) (Figure 1). Additional findings reported in the Subsurface Investigation Report and the Bioremediation Treatability Study Results (RMT, 1999) indicated that anaerobic biodegradation of the groundwater impacted with TCE and TCA is occurring in both areas, and could be accelerated using *in situ* enhanced bioremediation.

RMT elected to enhance the *in situ* bioremediation of TCE and TCA at Tecumseh through lactate injections. As described in the WDNR Publication RR-699, "Understanding Chlorinated Hydrocarbons" (WDNR, 2003), anaerobic biodegradation of TCE and TCA can occur by reductive dechlorination. In reductive dechlorination, TCE and similar chlorinated compounds are reduced by the replacement of a chlorine atom with a hydrogen atom. When lactate is introduced into the subsurface and is biodegraded, other volatile fatty acids (VFAs) are produced and degraded, and hydrogen is generated. The hydrogen produced in this reaction serves as the electron donor in the reductive dechlorination of TCE and similar chlorinated compounds. Consequently, the introduction of lactate into the subsurface can enhance the reductive dechlorination of TCE and TCA. The specific goal of the enhanced bioremediation was to reduce the concentrations of TCE in the source area groundwater by 50 percent of the initial concentrations, or to complete injections for 5 years, whichever came first.

Mr. John Feeney
Wisconsin Department of Natural Resources
May 2, 2007
Page 2

In October and November 2002, three injection wells and four infiltration trenches were constructed at Tecumseh for the purpose of *in situ* enhanced bioremediation of the groundwater and soil using lactate injections. In addition, four monitoring wells (MW-23, MW-24, MW-25, and MW-26) were installed during that time for purposes of evaluating the lactate injection system. The details of the construction of the wells and trenches were described and submitted to the WDNR in a Construction Documentation Report (RMT, 2003). Monitoring well MW-24 was paved over when the parking lot near the Recycling Dock area was resurfaced in June 2003. Consequently, this well was replaced with MW-24R in November 2003, and the documentation of the construction of MW-24R was submitted to the WDNR in the 2003 Annual Status Report for the site (RMT, 2004). The locations of the wells and trenches are shown on Figure 1.

Over the past 5 years, RMT has completed seven injections at the site, with the first injection occurring in November 2002. The November 2002 and April 2003 injections are summarized in the 2003 Annual Status Report, the December 2003 and April 2004 injections are summarized in the 2004 Annual Status Report, and the March 2005 and February 2006 injections are summarized in the 2005/2006 Annual Status Report. The details on the most recent injection are summarized below.

Site Activities

Recycling Dock Area

No injections were completed in the Recycling Dock Area over the past year, per the recommendations presented in the 2005/2006 Annual Status Report. Evaluation of the monitoring data for the area indicated that the remedial objectives had been met, and additional injections in the area were not necessary. Rather than complete additional injections in the Recycling Dock Area, the resources allocated for an injection in the Recycling Dock were directed at the injection the West Dock Area. Further information on the fulfillment of the remedial objectives in the Recycling Dock will be discussed later in this report.

West Dock Area

One lactate injection was completed in the West Dock Area between May 18 and July 13, 2007. The total flow volume recorded during the injection was 57,436 gallons. The target concentration of sodium lactate was 14,000 mg/L, which was double the concentration used in the previous injection (7,000 mg/L), per the recommendations presented in the 2005/2006 Annual Status Report. The target concentrations of sodium sulfide, yeast extract, and sodium bicarbonate were consistent with previous injections, at 30 mg/L, 10 mg/L, and 37 mg/L, respectively.

Mr. John Feeney
Wisconsin Department of Natural Resources

Page 3

Groundwater Sampling

The performance monitoring program for the *in situ* enhanced bioremediation includes monitoring wells MW-8, M-8D, MW-23, MW-24R, MW-25, and MW-26; and the locations of these wells are shown on Figures 1 through 3. Monitoring wells MW-8 through MW-24R are used to evaluate the Recycling Dock Area (Figure 2), and monitoring wells MW-25 and MW-26 are used to evaluate the West Dock Area (Figure 3). RMT collected groundwater samples from each well on August 15, 2006, following the injection that was completed in the West Dock Area in July 2006.

Soil Sampling

RMT and the Geoprobe® subcontractor, SGS, Inc., were on-site on August 16, 2006, to collect two soil samples from the West Dock Area. Soil samples have been collected annually since the *in situ* enhanced bioremediation began, in order to evaluate leaching and removal of TCE from the unsaturated zone beneath the infiltration trenches. Numerous soil samples were collected in the West Dock Area in August 1995 during the Subsurface Investigation, the results of which are documented in the Subsurface Investigation Report. A cross section of the concentration of TCE in the soil in the West Dock Area, based on the 1995 soil data, is included on Figure 4. Two areas in the unsaturated soil that contained high concentrations of TCE were targeted and sampled during the 2003, 2004, and 2005 soil sampling events (GP-1 and GP-2). These same locations were targeted and sampled during the August 2006 sampling event. The locations of the two borings, GP-1 and GP-2, and the depths from which the soil samples were collected in each boring, are shown on Figure 3 and Figure 4, respectively.

Groundwater Analysis

The groundwater samples collected during the August 2006 groundwater monitoring event were submitted to Pace Analytical for laboratory analysis. The samples were laboratory-analyzed for volatile organic compounds (VOCs), volatile fatty acids (VFAs), and chloride. The laboratory reports are included in Attachment A. In addition, the water level, pH, specific conductivity, temperature, oxidation-reduction potential, and dissolved oxygen concentration of the groundwater samples were measured in the field during each sampling round. The results of the VOC and chloride analyses are summarized in Table 1, and the results of the field parameter and VFA analyses are summarized in Table 2.

Recycling Dock Area

The temporal and spatial trends in the groundwater monitoring data support that reductive dechlorination has been ongoing in the Recycling Dock Area since the first lactate injection, and has continued over the last year despite the fact that no injections were completed this year.

Mr. John Feeney
Wisconsin Department of Natural Resources
May 2, 2007
Page 4

The baseline groundwater monitoring event indicated that the intrinsic biodegradation of TCE had reduced the concentration of TCE to below the NR 140 ES in all of the performance monitoring wells in the Recycling Dock Area, except MW-24, prior to the start of the lactate injection. The concentration of TCE dropped and has remained below the NR 140 ES in MW-24R since the injections began. Based on the August 2006 data, the concentrations of TCE have been reduced by 95 percent (29 to 1.3 µg/L) in MW-24R, as a result of the injections.

There are currently no exceedences in the NR 140 ESs for TCE; cis-1,2-DCE; trans1,2-DCE; or 1,1-DCE; in the Recycling Dock Area; however, vinyl chloride, the final daughter product in the reductive dechlorination of TCE, has been detected in each of the performance monitoring wells at concentrations above the NR 140 ES. The important trend to note is that the vinyl chloride degrades as it moves downgradient from the source area, such that the concentrations are generally near or below the NR 140 ES by the time the groundwater reaches the downgradient monitoring point MW-24R. During the August 2006 monitoring event, vinyl chloride decreased from 9.4 to 0.38 µg/L in the 85 feet between MW-8 and MW-24R.

Similar to TCE, the baseline groundwater monitoring event indicated that the intrinsic biodegradation of TCA had reduced the concentration of TCA to below the NR 140 ES in all of the performance monitoring wells in the Recycling Dock Area prior to the start of the lactate injection. However, the daughter product of TCA, 1,1-dichloroethane (DCA), was present in monitoring well MW-23 at 47,000 µg/L, during the baseline monitoring event. This concentration was above the NR 140 ES of 850 µg/L.

The lactate injections have successfully enhanced the reductive dechlorination of 1,1-DCA. Based on the August 2006 monitoring data, the concentration of 1,1-DCA has been reduced by 99 percent in MW-23 (47,000 to 220 µg/L), as a result of the injections. The decrease in the concentration of 1,1-DCA has been matched by the increase in the concentration of its daughter product, chloroethane, suggesting that reductive dechlorination is responsible for the decrease in concentration. Between the February and August 2006 sampling round, the concentration of chloroethane decreased from 18,000 to 5,500 µg/L in MW-23, suggesting that the degradation of chloroethane is now occurring in MW-23.

The TCA; 1,1-DCA; and chloroethane all degrade spatially within the Recycling Dock Area, such that each are at concentrations below their respective NR 140 ESs in downgradient monitoring well MW-24R. The significant decrease in concentrations of 1,1-DCA and chloroethane between MW-23 and MW-24R suggests that biodegradation is occurring within the span between M-23 and M-24R.

Mr. John Feeney
Wisconsin Department of Natural Resources
May 2, 2007
Page 5

The presence of residual VFAs in monitoring wells, as summarized in Table 2, provides further support that conditions are supportive of anaerobic biodegradation in the Recycling Dock Area. As mentioned previously, VFAs are generated when lactate is biologically degraded. VFAs were detected in MW-8, MW-8D, and MW-23, at concentrations ranging from 15 to 450 mg/L. The highest concentrations of the VFAs were detected in well MW-23, and no VFAs were detected in MW-24R, suggesting that the electron donors (lactate and VFAs) have been consumed by the time the groundwater reaches MW-24R.

Other geochemical parameters summarized in Table 2 also suggest that conditions are supportive of reductive dechlorination in the Recycling Dock Area. The concentrations of dissolved oxygen are generally below 0.5 mg/L, and the oxidation reduction potential is consistently below 50 mV (Table 2). Both of these conditions support reductive dechlorination as described in WDNR Publication PUB-RR-5184, *Quick Reference Guide to Natural Degradation of Chlorinated Solvents*.

West Dock Area

Concentrations of TCE were detected in the vadose zone in the West Dock Area during the site investigations, and these impacts were serving as the source to the elevated concentrations of TCE in the groundwater. The gravity infiltration trenches in the West Dock Area were designed to flush the TCE from the vadose zone and to anaerobically degrade the TCE in the groundwater. The two performance monitoring wells in the West Dock Area, are designed to evaluate these two anticipated processes. Specifically, monitoring well MW-25 is directly below the infiltration trenches, within the source area, and MW-26 is approximately 50 feet downgradient from MW-25.

Temporal trends in the molar concentration of TCE; cis-1,2-DCE; and vinyl chloride in MW-25 and MW-26 are shown on Figures 5 and 6, respectively. The trends indicate that lactate is flushing the high concentration of TCE from the vadose zone near MW-25, as shown by the increase in the concentration of TCE in MW-25 since the injections began. The lactate concentration used for the injections was increased following the August 2004 monitoring event. The higher concentration of lactate used during the injections after August 2004 likely had a surfactant or co-dissolution effect on TCE in the vadose zone, thereby enhancing the leaching process, and accounting for the increase in the concentration of TCE in MW-25 during the August 2005 and August 2006 monitoring events.

The trends in the concentration data also show that the lactate solution is enhancing the anaerobic biodegradation of the TCE in the groundwater as it moves downgradient toward MW-26. The concentration of TCE has decreased while the concentrations of cis-1,2-DCE and vinyl chloride have increased in MW-26 since the baseline monitoring event. The concentrations of TCE have remained relatively stable in MW-26 following the first injection despite the increases in the concentration of

Mr. John Feeney
Wisconsin Department of Natural Resources
May 2, 2007
Page 6

TCE observed upgradient in MW-25. Based on the August 2006 monitoring event, the concentration of TCE has been reduced by 90 percent (950 to 97 µg/L) in MW-26 as a result of the injections.

The concentration of vinyl chloride in MW-26 in the West Dock Area has shown a decreasing trend since November 2003 and is expected to continue to decrease as reductive dechlorination continues at the site. Vinyl chloride will likely degrade aerobically, once it is downgradient of the reducing zone created by the lactate injections.

As summarized in Table 2, VFAs were not detected in the West Dock Area during the August 2006 monitoring event. However, since the pattern of the concentrations of TCE and its breakdown products suggests that reductive dechlorination of TCE is occurring as a result of the lactate injections, it can be assumed that the lactate is being biodegraded in the West Dock Area.

As in the Recycling Dock Area, the trends in the other geochemical parameters summarized in Table 2 suggest that conditions are supportive of reductive dechlorination in the West Dock Area. The concentration of dissolved oxygen is generally below 1.0 mg/L, and the oxidation reduction potential is consistently below 50 mV. Both of these conditions support reductive dechlorination as described in WDNR Publication PUB-RR-5184, *Quick Reference Guide to Natural Degradation of Chlorinated Solvents* (WDNR, 2002). A stronger reducing environment appears to have been established following the most recent injection, in which the concentration of lactate was doubled. The ORP decreased from 3 to -75 mV and from -91 to -175 mV in monitoring wells MW-25 and MW-26, respectively.

Soil Analysis

West Dock Area

The soil samples collected in August of 2006 were submitted to Pace Analytical Laboratory and analyzed for VOCs. The laboratory reports are included in Attachment A, and the results are summarized in Table 3. As mentioned previously, the borings drilled in August of 2006 (GP-1 and GP-2) targeted the depth and location of two areas in the soil that had high concentrations of TCE according to data collected in 1995, and from which soil samples were collected during 2003, 2004, and 2005.

The concentration of TCE in the soil samples collected 6 feet below grade from borings GP-1 had been decreasing since the startup of the lactate injections, but increased from 340 to 6,900 µg/kg during the August 2005 monitoring event. This increase was attributed to the enhanced solubility of TCE that resulted from the increase in the concentration of sodium lactate. The concentration of TCE in the soil samples collected 11 feet below grade from boring GP-2 had consistently increased between the first and the August 2005 monitoring events. The increasing trend was attributed to the mobilization of

Mr. John Feeney
Wisconsin Department of Natural Resources
May 2, 2007
Page 7

TCE from the shallower unsaturated soil, and the temporary accumulation of TCE within the deeper soil as the TCE makes its way to the groundwater. During the August 2006 sampling, the concentration decreased significantly in both borings. Specifically, the concentrations decreased from 6,900 to 1,000 µg/kg and from 49,000 to 16,000 µg/kg in borings GP-1 and GP-2, respectively. This decrease suggests that the infiltration of the lactate solution through the vadose zone, has promoted the leaching of TCE from the soil and has successfully reduced the overall mass of TCE in the West Dock source area.

Conclusions and Recommendations

The remedial objectives for the *in situ* enhanced bioremediation in the Recycling Dock and West Dock Areas have been met for the site.

Recycling Dock Area

In the Recycling Dock Area, the concentration of TCE has been reduced by 99 percent, which is well above the remedial goal of 50 percent. In addition to the remedial objective established for TCE, the concentration of 1,1-DCA has also been reduced by 99.5 percent, from 47,000 to 220 µg/L, in the source area. There are currently no NR 140 ES exceedences for TCE, cis-1,2-DCE, TCA, or 1,1-DCA in the Recycling Dock Area. Elevated concentrations of vinyl chloride and chloroethane, the end products in the reductive dechlorination of TCE and TCA, do remain in the source area, but each are degrading spatially across the extent of the plume and are at concentrations near or below the NR 140 ES at the property boundary for the site.

West Dock Area

In the West Dock Area, the concentration of TCE has increased in source area well MW-25, since the injections began, as a result of the leaching of TCE from the vadose zone that was promoted by the use of the infiltration trenches. Although the general remedial objective for the project was to achieve a 50 percent reduction in the concentration of TCE in the source areas, in the case of the West Dock location, it is more appropriate to evaluate the concentration of TCE in downgradient well MW-26, where reductive dechlorination in the groundwater has had an opportunity to reduce the overall mass of TCE. Even with the accelerated leaching of TCE near MW-25, the concentration of TCE has been reduced by 90 percent in MW-26, from 950 to 97 µg/L, as a result of the injections. Concentration of TCE; cis-1,2-DCE; and vinyl chloride do remain in the West Dock Area, but are degrading spatially across the plume as shown by the significant decrease in concentration between MW-25 and MW-26.

The leaching of TCE from the vadose zone in the West Dock Area has reduced the mass of TCE in the unsaturated source area. The concentration of TCE in the unsaturated soil has been reduced by approximately 85 percent between the 1995 SI and the most recent round of soil sampling.

Mr. John Feeney
Wisconsin Department of Natural Resources
May 2, 2007
Page 8

Five years of *in situ* enhanced bioremediation have been completed for the site and reductions in the concentration of TCE over 50 percent were achieved in the Recycling Dock and West Dock Areas. Therefore, the remedial objectives established for the site have been met, and no additional injections are recommended for the Recycling Dock or West Dock Areas. We recommend that semiannual monitoring for VOCs and the field parameters previously listed continue in the performance monitoring wells at the site to evaluate natural attenuation trends.

Please feel free to contact Alyssa Sellwood, at 608-662-5480, or John Rice, at 608-662-5173, if you have any questions.

Sincerely,

RMT, Inc.

Notes:

Table only includes those CVOCs (and chloride) that are part of the enhanced biodegradation study.
 Wells are listed from upgradient to downgradient location for each area.

ES = Enforcement Standard.

PAL = Preventive Action Limit.

NS = not sampled.

ND = analyte not detected; however, the Limit of Detection was not available.

NA = not analyzed.

Q or J = concentration between the Limit of Detection and Limit of Quantitation.

D = concentration is an estimate as it exceeded the linear range of the calibration curve.

BOLD = concentration exceeds NR 140 PAL.

Bold and Shaded = concentration exceeds NR 140 ES.

DCA = dichloroethane.

DCE = dichloroethene.

TCA = trichloroethane.

TCE = trichloroethene.

Prepared By: AAS 8/31/06
 Checked By: RJG 8/31/06

Footnotes:

⁽¹⁾ Samples were collected by Moraine Environmental, Inc.

⁽²⁾ Results from Subsurface Investigation Report for Tecumseh Products Company (RMT, 1997).

⁽³⁾ Well was not sampled because it was dry.

⁽⁴⁾ Well was not sampled because it had been paved over.

The well was replaced with MW-24R on November 11, 2003.

Prepared By: AAS 8/31/06

Checked By: RJJ 8/31/06

Notes:

NA = not analyzed.

NS = not sampled.

J = estimated value.

Footnotes:

⁽¹⁾ Well MW-8D was not sampled on November 20, 2003, because it could not be located.

⁽²⁾ Well MW-8 was not sampled on March 27, 2003, because it was dry.

⁽³⁾ Conductivity probe was not working on March 27, 2003.

⁽⁴⁾ Sample was foaming/fizzing. Foaming is likely due to organics in water at elevated pH, and fizzing is likely due to CO₂ release.

⁽⁵⁾ Elevated DO is likely due to inability to obtain a reliable reading from foaming/fizzing groundwater.

⁽⁶⁾ Well MW-24 was not sampled on June 16, 2003, because it had been paved over. The well was replaced with MW-24R on November 11, 2003.

⁽⁷⁾ Optimum conditions = geochemical conditions or trends that support reductive dechlorination, as listed in WDNR Publication PUB-RR-5184, "Quick Reference Guide to Natural Degradation of Chlorinated Solvents."

⁽⁸⁾ A DO concentration of <1.5 mg/L is optimum; however, the bulk DO in groundwater is not always the best indication of what may be happening in microcosms within the subsurface.

Oftentimes, reductive dechlorination is observed at a DO concentration of 1 to 2 mg/L.

Notes:

Table only includes those CVOCs that are part of the enhanced biodegradation study.

Prepared By: AAS 8/31/06

NS = not sampled.

Checked By: RJG 8/31/06

NA = not analyzed.

Q = concentration between the Limit of Detection and Limit of Quantitation.

D = concentration is from diluted analysis.

DCA = dichloroethane.

DCE = dichloroethene.

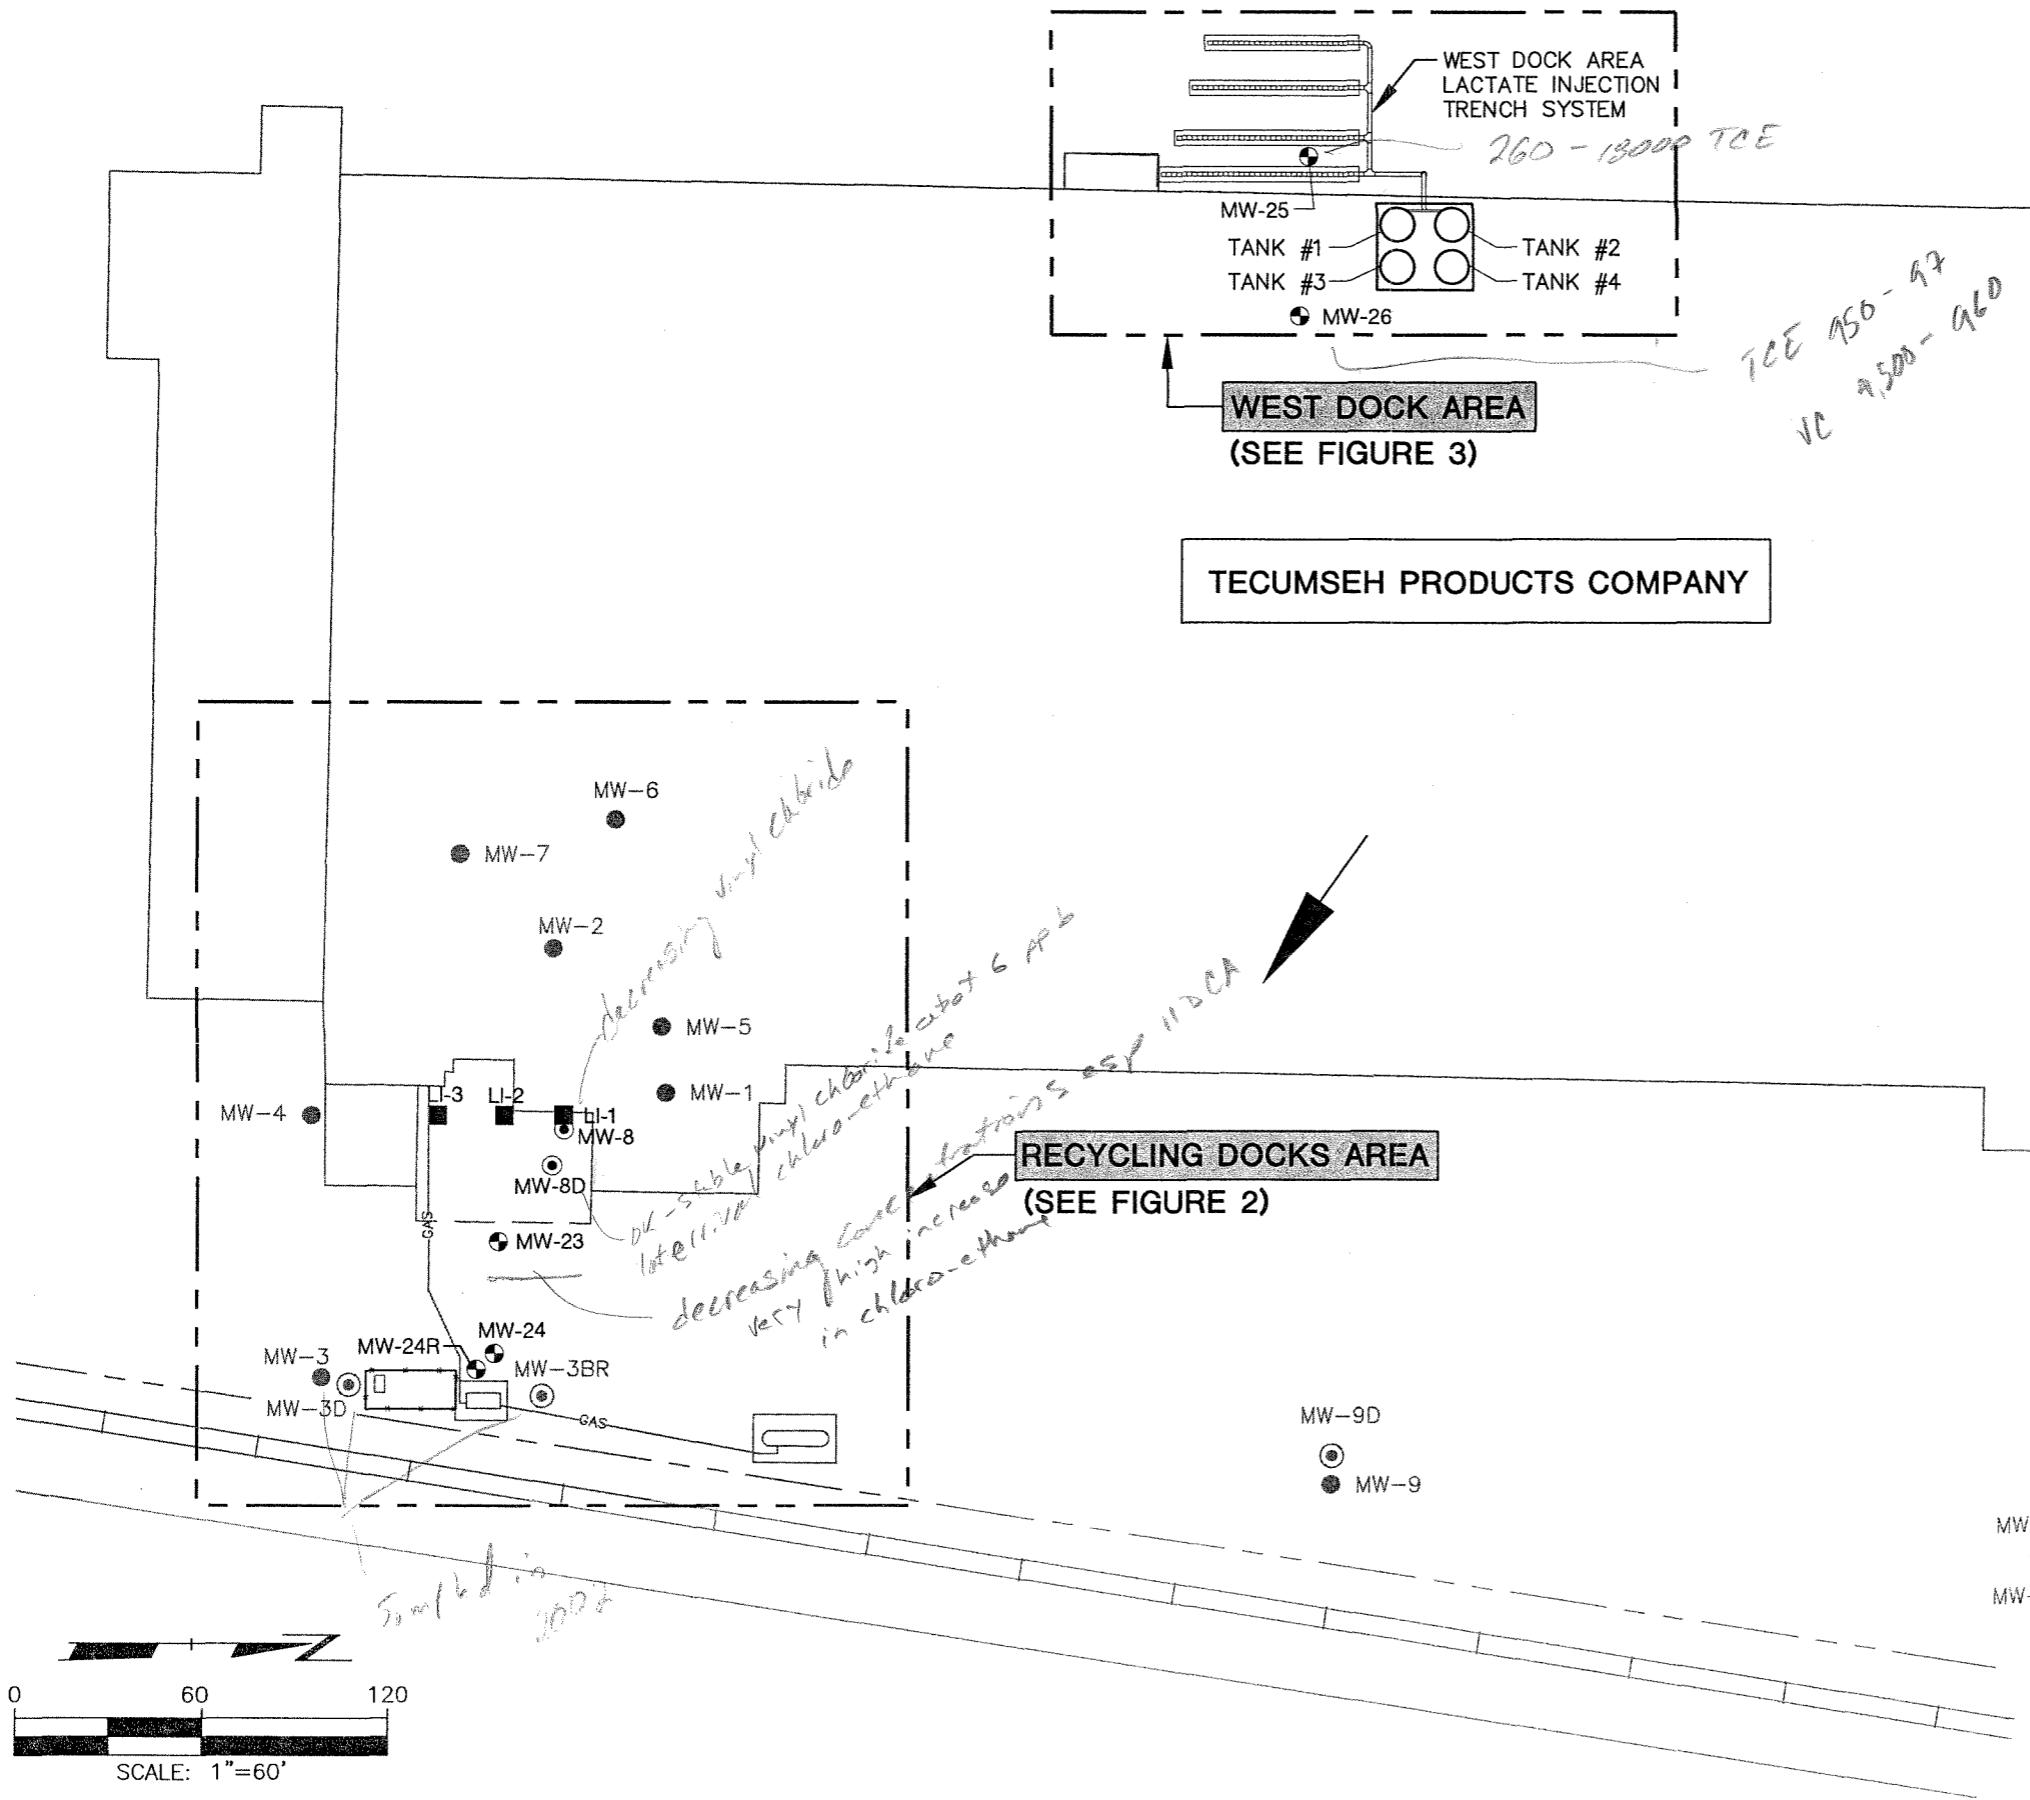

TCA = trichloroethane.

TCE = trichloroethene.

Lab Number	TestGroupID	Field ID	Comment
875236-003	SPECVOA-W	MW24R	X - It is likely that the concentration of PCE detected in the sample is due to contamination from the sample bottle used. We know that the contamination did not occur in the laboratory based on our internal quality control results.
875236-006	SPECVOA-W	MW8	X - It is likely that the concentration of PCE detected in the sample is due to contamination from the sample bottle used. We know that the contamination did not occur in the laboratory based on our internal quality control results.

Qualifier Codes

Flag Applies To Explanation

A	Inorganic	Analyte is detected in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
B	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
B	Organic	Analyte is present in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
C	All	Elevated detection limit.
D	All	Analyte value from diluted analysis or surrogate result not applicable due to sample dilution.
E	Inorganic	Estimated concentration due to matrix interferences. During the metals analysis the serial dilution failed to meet the established control limits of 0-10%. The sample concentration is greater than 50 times the IDL for analysis done on the ICP or 100 times the IDL for analysis done on the ICP-MS. The result was flagged with the E qualifier to indicate that a physical interference was observed.
E	Organic	Analyte concentration exceeds calibration range.
F	Inorganic	Due to potential interferences for this analysis by Inductively Coupled Plasma techniques (SW-846 Method 6010), this analyte has been confirmed by and reported from an alternate method.
F	Organic	Surrogate results outside control criteria.
G	All	The result is estimated because the concentration is less than the lowest calibration standard concentration utilized in the initial calibration. The method detection limit is less than the reporting limit specified for this project.
H	All	Preservation, extraction or analysis performed past holding time.
HF	Inorganic	This test is considered a field parameter, and the recommended holding time is 15 minutes from collection. The analysis was performed in the laboratory beyond the recommended holding time.
J	All	Concentration detected equal to or greater than the method detection limit but less than the reporting limit.
K	Inorganic	Sample received unpreserved. Sample was either preserved at the time of receipt or at the time of sample preparation.
K	Organic	Detection limit may be elevated due to the presence of an unrequested analyte.
L	All	Elevated detection limit due to low sample volume.
M	Organic	Sample pH was greater than 2
N	All	Spiked sample recovery not within control limits.
O	Organic	Sample received overweight.
P	Organic	The relative percent difference between the two columns for detected concentrations was greater than 40%.
Q	All	The analyte has been detected between the limit of detection (LOD) and limit of quantitation (LOQ). The results are qualified due to the uncertainty of analyte concentrations within this range.
S	Organic	The relative percent difference between quantitation and confirmation columns exceeds internal quality control criteria. Because the result is unconfirmed, it has been reported as a non-detect with an elevated detection limit.
U	All	The analyte was not detected at or above the reporting limit.
V	All	Sample received with headspace.
W	All	A second aliquot of sample was analyzed from a container with headspace.
X	All	See Sample Narrative.
Z	Organics	This compound was separated in the check standard but it did not meet the resolution criteria as set forth in SW846.
&	All	Laboratory Control Spike recovery not within control limits.
*	All	Precision not within control limits.
+	Inorganic	The sample result is greater than four times the spike level: therefore, the percent recovery is not evaluated.
<	All	The analyte was not detected at or above the reporting limit.
1	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses passed QC based on precision criteria.
2	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses failed QC based on precision criteria.
3	Inorganic	BOD result is estimated due to the BOD blank exceeding the allowable oxygen depletion.
4	Inorganic	BOD duplicate precision not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
5	Inorganic	BOD result is estimated due to insufficient oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
6	Inorganic	BOD laboratory control sample not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
7	Inorganic	BOD result is estimated due to complete oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.

Microseeps test results meet all the requirements of the NELAC standards.

Approved By:

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

*As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.*
