TECHNICAL MEMORANDUM

TO: Jon Heberer and Mike Schmoller, WDNR

FROM: Eric Oelkers and Sherren Clark, SCS Engineers

CC: See list on last page of memorandum

SUBJECT: Phase 3 Investigation Update – P429D Drilling Status and Proposed Well Installation, Land & Gas Reclamation Landfill

This Technical Memorandum provides an update on the status and results of drilling the P429D borehole as part of Phase 3 of the investigation of volatile organic compounds (VOCs) in the bedrock aquifer downgradient from the former Land and Gas Reclamation Landfill (LGRL) location. The work was done in accordance with the April 2012 investigation work plan and the recommendations of the Phase 2 investigation update letter submitted to the Wisconsin Department of Natural Resources (WDNR) in June 2016. The Phase 3 objective is to install a monitoring well to better define the downgradient extent of the plume and to serve as a sentinel well for downgradient water supply wells.

For the proposed well installation, we are requesting approval of an exception to NR 141, as described in detail in the Proposed Well Construction section of this memorandum.

This memorandum also provides an update on groundwater monitoring results for the bedrock monitoring wells and water supply wells being monitored as part of the bedrock groundwater investigation.

A complete report on the Phase 3 investigation will be submitted after completion of the well installation and initial groundwater sampling.

P429D Drilling Status and Results

SCS Engineers (SCS) mobilized to the P429D well site on the Andy Oeschner property (see **Figure 1**) on January 9, 2017, after getting access approval and waiting for suitable ground conditions (frost but not too much snow and ice) to allow access by the drilling equipment. Shale bedrock was encountered at 57 feet, and a 6-inch temporary casing was installed to a depth of 78 feet below ground surface (bgs) in an 8.5-inch borehole. A total of 80 feet of casing were used, leaving 2 feet of casing sticking up above the ground surface. The casing was fitted with a drive shoe and was seated firmly into the shale. The hole was then drilled to 160 feet. No drilling occurred on January 10 because of bad weather.

On January 11, 2017, prior to the resumption of drilling, the measured depth to water from the top of the temporary casing was 49.38 feet inside the casing and 10 feet in the annulus outside the casing. Two bags of chips were added to the annular space prior to the resumption of drilling. Dolomite bedrock was encountered at 210 feet. The initial planned borehole depth was 260 feet, to potentially intercept the fracture zone identified in the upper dolomite at monitoring wells P402E, P424D, and P423D. At this location, little or no apparent water was encountered in the upper portion of the dolomite, so the borehole was extended to a depth of 380 feet. The measured depth to water at the completion of drilling was 375 feet. The geologic units encountered are shown on the attached NE-SW cross section (see **Figures 2 and 3**).

SCS returned to the site on February 9, 2017, to log the well using geophysical tools. Borehole logs are shown on **Figure 4**. The depth to water was 28.93 feet, and the approximate depth to bottom was 378 feet from the top of casing (TOC), or 376 feet bgs. Logging parameters included gamma (natural radiation/clay minerals), caliper (borehole diameter), fluid temperature and conductivity under static and pumped conditions, and borehole flow using a heat pulse tool. The borehole was pumped down to the level of the pump intake at approximately 94 feet below TOC, for a drawdown of 70 feet. The water level recovered to a depth of 82.4 feet below TOC, a distance of 11.6 feet in 141 minutes. This recovery corresponds to a flow of 0.12 gallons per minute, over the entire open length of the borehole, from 78 to 376 feet.

Compared to the shale, the dolomite appears massive and relatively unfractured in the caliper log, with a possible fracture at about 235 feet bgs. The fluid temperature log shows no sharp changes in the dolomite, with an inflection at a depth of about 185 feet in the shale. The fluid conductivity was also very uniform in the dolomite, with spikes at about 138 and 160 feet bgs in the shale. The heat pulse flow meter did not detect any flow (upward or downward) in the borehole.

Based on the borehole logging and pumping data for the P429D borehole, it appears that very little groundwater is moving through the dolomite at this location. Dan Antonioni, the well pump contractor that owns the residence and farm property supplied by PW19, reports that his well is the only one in the immediate area that produces appreciable quantities of water from the dolomite.

The observed low hydraulic conductivity of the dolomite at this location indicates that there is low potential for contaminant transport through this unit, except where fractures are present. Although a fracture zone has been observed near the top of the dolomite at other locations, it does not appear to be present at the P429D location.

Proposed Well Construction

The approved work plan proposed construction of a single well at this location, in the upper dolomite; however, as discussed with you during the week of May 8, 2017, we propose to modify this approach based on the drilling and logging observations of little or no flow in the upper dolomite at this location. We propose to drill the existing P429D borehole down into the uppermost sandstone below the dolomite and install a 2-inch monitoring well (P429SS) screened

for 15 feet in the upper sandstone. The sandstone well will be used to identify whether the contamination present at PW-21RR is moving in the apparent downgradient direction to the northeast.

Following sampling of the sandstone well, we will reevaluate the need for installation of a second shallower well in the dolomite. If installed, we anticipate that the second well will be screened in the dolomite at the projected elevation of the fracture zone identified in monitoring wells P402E, P424D, and P423D. The dolomite well would be used to identify whether water is present in the dolomite at this location and whether 1,2-dichloroethene (DCE) may be migrating in the dolomite toward PW-19.

In accordance with NR 141.31(1)(b), we are requesting approval of an exception to the NR 141 requirement regarding borehole diameter. The actual diameter of the bedrock borehole is slightly less than 6 inches (about 5 5/8 inches), which is less than the requirement for a borehole diameter 4 inches larger than the 2-inch inside diameter of the PVC well casing. In prior installations, there has been no problem placing the grout seal using tremie methods in the annular space between the nominal 6-inch borehole and the 2-inch PCV casing.

Groundwater Monitoring Results

The most recent data from the bedrock monitoring wells and water supply wells are summarized in **Tables 1, 2, and 3**. Trends in concentrations of DCE and vinyl chloride at the bedrock monitoring wells and water supply wells where these VOCs have been detected are shown on **Figures 5 through 8**. As indicated in **Table 2** and on **Figures 5 and 6**, contaminant concentrations in groundwater monitoring wells located along the apparent centerline of the plume (P402E, P424D, and P423D) show decreasing or stable trends.

In the water supply wells where DCE has been detected (PW-21RR, PW19, PW-28, and PW32), concentrations have remained relatively stable over the past 3 years as shown in **Table 3** and on **Figure 7**, and are well below the drinking water standard. Vinyl chloride has only been detected in one active water supply well (PW-21RR), and concentrations have generally followed a gradual decreasing trend for the last several years since the well was installed, as shown in **Table 3** and on **Figure 8**.

Recommendations

Based on the results of the drilling and monitoring to date, the following next steps are proposed:

1. Extend the P429D borehole into the top of the sandstone and install a monitoring well in the upper 15 feet of sandstone as described in more detail above.
2. Collect one round of samples from the new monitoring well approximately 1 month after installation, then add the new well to the semiannual monitoring program.
3. Continue the semiannual monitoring program for existing monitoring wells and water supply wells.

4. Reassess the need for a well screened in the dolomite at the P429SS location based on sampling results.

Please let us know if you have any questions or concerns regarding the proposed approach, and whether you approve the requested exception to NR 141.

Table 2. LGRL VOC Investigation Bedrock Well Sample Results - Through April 2017

Abbreviations:

ND = Not detected
NS = No standard established
mg/L = Milligrams per Liter
µg/L = Micrograms per Liter

Siemens = Siemens Water Technologies
TA = TestAmerica, Watertown, WI
Pace = Pace Analytical Services, Inc., Green Bay, WI
-- = Not Analyzed

Bold indicates detected compound.

Bold and underline indicates result above drinking water standard.

Lab Notes/Qualifiers:

J = Estimated value below laboratory limit of quantitation.

CSH = Check standard for this analyte exhibited a high bias. Sample results may also be biased high.

Table 3. LGRL VOC Investigation Water Supply Well Sample Results - Through April 2017

Abbreviations:

NS = No standard established
TTHM = Trihalomethanes (disinfection byproducts including chloroform)
ND = Not detected
mg/L = Milligrams per Liter
µg/L = Micrograms per Liter
-- = Not Analyzed

CT = CT Laboratories, Baraboo, WI
NLS = Northern Lake Service, Inc., Crandon, WI
Siemens = Siemens Water Technologies
TA = TestAmerica, Watertown, WI
Pace = Pace Analytical Services, Inc., Green Bay, WI

Bold indicates detected compound.
Bold and underline indicates result above drinking water standard.

Notes:

- * Sample collected at the pressure tank prior to the iron filtration system.
** Sample collected at the kitchen tap after the water passed through the iron filtration system.

Laboratory Notes/Qualifiers:

B = Compound also detected in blank sample
J = Estimated value below laboratory limit of quantitation
H1 = Analysis conducted outside the recognized method holding time. Analyzed 2 days outside of hold time.
L2 = Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
L3 = Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
N2 = The lab does not hold The NELCA Institute (TNI) accreditation for this parameter.
