TECHNICAL MEMORANDUM

TO: Trevor Bannister, WDNR

FROM: Sherren Clark and Eric Oelkers, SCS Engineers

SUBJECT: Land and Gas Reclamation Landfill – Changed Site Conditions

SCS Engineers (SCS) prepared this memo on behalf of Glacier Ridge Landfill, LLC (GRL) in response to Recommendation #1 in the 5-Year Review Report. The memo documents the observed changes in site conditions resulting from the relocation of waste from the former Land and Gas Reclamation Landfill (LGRL).

As established in the 1994 Record of Decision (ROD) for LGRL, the site consists of two operable units (OUs). OU1 is the source control remedy, and OU2 is the groundwater remedy (long-term monitoring). The OU1 source control remedy originally included installation of a clay cap and expansion of the landfill gas collection system, which were completed in the early 1990s. The relocation of the LGRL waste in 2014 through 2016 essentially completed the OU1 response by removing the source.

The LGRL waste removal has been documented in Construction Documentation Reports that were prepared by Cornerstone Environmental Group (Cornerstone) after each of the three phases of waste removal and submitted to the Wisconsin Department of Natural Resources (WDNR). This memo references information contained in those reports to document the changes that have occurred with respect to the OU1 and OU2 remedies selected in the ROD.

In recognition of the completion of source control activities under OU1 through source removal, finalization of the Explanation of Significant Differences (ESD) is an appropriate next step.

CHRONOLOGY AND INFORMATION SOURCES

A chronology of the approval and implementation process for the LGRL waste removal is provided below. Milestone reports and approvals leading up to the waste removal are listed, followed by the dates of the waste removal activities and corresponding documentation reports. Planning and approvals for the waste relocation were integral to the planning and approvals for the Southeast Expansion of GRL (Subtitle D landfill) into the former LGRL area after the waste was removed; therefore, many of the document titles reference the GRL Southeast Expansion. The Southeast Expansion documents and approvals included detailed plans and conditions for the LGRL waste relocation.

Waste Relocation Chronology

Date	Event
7/23/2009	Initial Site Report, Southeast Expansion, Veolia ES Glacier Ridge Landfill, submitted by BT Squared
12/8/2010	Feasibility Report, Proposed Southeast Expansion, Veolia ES Glacier Ridge Landfill, submitted by BT Squared
6/30/2011	Addendum No. 1 – Feasibility Report, Proposed Southeast Expansion, Veolia ES Glacier Ridge Landfill, submitted by BT Squared
4/17/2012	WDNR Determination of Site Feasibility, Veolia ES Glacier Ridge Landfill Southeastern Horizontal and Vertical Landfill Expansion, License #3068
4/23/2013	Plan of Operation, Advanced Disposal Services Glacier Ridge Landfill, Southeast Expansion, submitted by SCS Engineers (SCS), including LGRL Waste Removal Plan; Addendum 1 submitted 6/28/2013; Addendum 2 submitted 10/3/2013
10/13/2013	WDNR approval of Southeast Expansion Plan of Operation and Hazardous Waste Remediation Variance
12/2013	LGRL Waste Removal Plan for Glacier Ridge Landfill Expansion, Revision 1, issued by SCS
3/10/2014 to 7/18/2014	Phase A of LGRL waste excavation
2/13/2015	Construction Documentation Report, Glacier Ridge Landfill – LGRL Phase A Waste Relocation, submitted by Cornerstone Environmental Group (Cornerstone)
2/3/2015 to 5/5/2015	Phase B of LGRL waste excavation
10/29/15	Construction Documentation Report, Glacier Ridge Landfill – LGRL Phase B Waste Relocation, submitted by Cornerstone
1/4/2016 to 3/21/2016	Phase C of LGRL waste excavation
12/23/16	Construction Documentation Report, Glacier Ridge Landfill – LGRL Phase C Waste Relocation, submitted by Cornerstone

For reference, a site map with monitoring well and private well locations is provided on **Figure 1**. Drawings from the Plan of Operation showing the phasing of the waste relocation are provided as **Attachment A**. Selected text, tables, and drawings from the waste relocation construction documentation reports are provided as **Attachments B**, **C**, and **D**.

ACTIONS MODIFYING SITE CONDITIONS

Waste Removal

The volumes of waste removed during each phase of excavation are summarized below. Soil within the waste was not segregated from the waste. No salvageable waste was identified during the waste relocation process.

The total mass of volatile organic compounds (VOCs) removed as part of the waste removal was calculated based on the median value for total concentrations of VOCs detected in each of the 24 samples of waste collected during waste characterization investigation activities in 2006 and 2007 (SCS 2013 Waste Removal Plan, Table 1). Because the waste samples collected during the waste characterization investigation were selected for analysis based in part on field screening indicating the potential presence of contamination, the estimated VOC mass based on these test results is likely biased high relative to the concentrations in the waste as a whole. The median total VOC concentration for the waste samples (38 milligrams per kilogram [mg/kg]) was used rather than the mean concentration (100 mg/kg) because it is believed to be more representative of typical waste. An estimated dry waste density of 1,200 pounds per cubic yard was assumed.

Waste Relocation Quantities and Estimated VOC Mass Removed

Phase	Typical Waste (cubic yards)	Suspicious Waste (cubic yards)	Salvageable Waste (cubic yards)	Estimated VOC Mass Removed (pounds)
A	584,394	120	0	27,000
B	413,758	20,472	0	20,000
C	301,252	8,410	0	14,000
Total	**1,299,404**	**29,002**	**0**	**Approx. 61,000**

The VOC mass removal calculations for the waste are provided in **Attachment E**.

Soil Excavation Below Waste

Soil excavation below the LGRL waste consists of two categories: 1) soil between the bottom of the waste and the design subbase grades for the GRL Southeast Expansion, which was excavated to facilitate construction of the GRL southeast expansion; and 2) soil below the subbase grades that was excavated for the purposes of contaminant remediation in accordance with the Waste Removal Plan.

For soil excavation from the bottom of LGRL waste to the subbase grades, the total mass of VOCs removed was calculated for each Phase based on the soil samples collected after the waste was removed, as documented in the waste removal documentation reports prepared by Cornerstone. Samples were typically collected from test pits excavated from the post-waste-removal soil surface to the approximate subbase grade. The depth to the subbase grade ranged from 0 to approximately

18 feet. The sample results were used to separate contaminated soil from soil meeting NR 720 standards that could be beneficially used on site without restrictions. The total VOC mass removal for each Phase was calculated based on the volume of contaminated soil reported in the documentation report and the average total VOC concentration for samples identified as contaminated (at least one VOC result above the NR 720 standard). For Phase C, the volume of contaminated soil was estimated based on the total estimated volume of soil between the LGRL waste and the subbase grades (133,600 cubic yards, from Sheet 10 in **Attachment A**) and the percent of the soil samples that exceeded an NR 720 soil standard (33 percent). A soil dry unit weight of 3,100 pounds per cubic yard (115 pounds per cubic foot) was assumed based on soil testing results from the 2010 Glacier Ridge Feasibility Report.

Each Phase of waste removal also included some targeted soil excavation below the subbase grades in one or more areas where higher VOC concentrations were present. For the excavation below the subbase, the total mass of VOCs removed was calculated based on the volume of contaminated soil reported in the documentation report and the average VOC concentration for the samples collected from the targeted soil excavation area.

Contaminated Soil Excavation Quantities and Estimated VOC Mass Removed

Phase	Excavation to Subbase (cubic yards)	Excavation Below Subbase (cubic yards)	Average VOC Concentration (mg/kg)	Estimated VOC Mass Removed (pounds)
A	8,497		18	470
		570	207	370
B	89,014		10	2,800
		800	158	390
C	Approx. 44,000		141	19,000
		2,856	4	35
Total	**Approx. 142,000**	**4,200**		**Approx. 23,000**

The VOC mass removal calculations and assumptions for the excavated soil are provided in **Attachment E**.

Remaining VOC Concentrations in Soil

The estimated remaining VOC concentrations in soil following the soil excavation are summarized in **Table 1**. These results include the deepest sample from each post-waste-removal test pit (at approximate subbase grade), plus additional test pit or confirmation samples in the areas of targeted excavation below the subbase. The sample location maps and complete soil sample summary tables from the previously submitted waste removal documentation reports for each Phase are included in **Attachments B**, **C**, and **D**. The laboratory reports were provided in the documentation reports. During the data review for Phase C, SCS noted that the sample results from the base of the Phase C targeted soil excavation (SS-28 to SS-36) were not included in the previously submitted Phase C documentation report. The laboratory report for these samples is included in **Attachment D**.

Average VOC concentrations in the remaining soil below the subbase are significantly lower than in the excavated soil. Concentrations above the NR 720 soil standards were detected in some samples, for chlorinated VOCs (CVOCs), petroleum VOCs, and 2-butanone (also known as methylethylketone (MEK)). Of these, only CVOCs have been identified as contaminants of concern in the groundwater

investigations at the site. Because the subbase grades for the GRL expansion were designed to be just above the water table, the majority of the contaminated soil above the water table was removed with the soil excavation.

Operation and Monitoring System Changes

The LGRL operating and monitoring systems in place prior to the waste removal project included the landfill gas collection and control system and the environmental monitoring system. The landfill gas system included gas extraction wells, header and lateral piping, blower, flare, and condensate tank. The landfill gas collection system was dismantled and the gas extraction wells were abandoned as the waste removal progressed.

Environmental monitoring system components affected by the waste removal included groundwater monitoring wells, leachate head wells, and gas monitoring probes. Portions of the environmental monitoring system that were located with the LGRL footprint and/or within the construction limits of the GRL Southeast Expansion were abandoned. Groundwater monitoring wells that were outside the construction limits were maintained for future monitoring.

All operation and monitoring systems associated with OU1 (source control) were removed with the waste removal. The remaining monitoring system components are groundwater monitoring wells associated with OU2 (groundwater).

Monitoring system changes completed for each phase were as follows:

- Phase A
  - Leachate head wells MW-2 and MW-3 abandoned by removal
  - Monitoring wells MW13AR, MW13R, P303A, P5R and P421B abandoned by over-drilling

- Phase B
  - Leachate head well MW-4 abandoned by removal
  - Gas probes GMP-1 through GMP-4 abandoned by removal (screened within waste)
  - Monitoring wells MW311R and P311A abandoned by over-drilling

- Phase C
  - Monitoring well MW407 abandoned by over-drilling

Monitoring well nest MW-428/P-428A was installed in the same area of the site as the former MW-407 after the Phase C waste removal was completed and the Southeast Expansion perimeter berm was constructed in this area.

The LGRL groundwater monitoring system remaining after completion of the waste removal included the following wells:

- Wells in approved landfill environmental monitoring plan under Waste and Materials Management (WMM) program: MW-1AR, MW-1RR, MW-6R, MW-7R, MW-8R, MW-201, MW-201A, MW-201B, MW-203A, MW-210, MW-210A, MW-210B, MW-214, MW-214A, W-3AR, W-3R, W-163, and W-163A

- Wells installed for bedrock groundwater investigation under WDNR Remediation & Redevelopment (R&R) program: MW-1B, P-401D, P-402E, P-422B, P-423D, P-424D, P-424SS, P-426D, and P-429SS

Glacier Ridge Landfill Construction

After each phase of waste removal, a phase of liner construction for the GRL Southeast Expansion was completed, on the following schedule:

- 2014: LGRL waste removal Phase A, Southeast Expansion Phase 6
- 2015: LGRL waste removal Phase B, Southeast Expansion Phase 7
- 2016: LGRL waste removal Phase C, Southeast Expansion Phase 8

Additional phases of GRL have been constructed since the completion of the waste removal and will be constructed in the future, but are outside the LGRL footprint.

Construction of the GRL Phases 6, 7, and 8 in the LGRL footprint provides several benefits for OU2, including the following:

- **Waste and soil removal:** Excavation to achieve the design subbase grades removed all of the LGRL waste and a significant volume of VOC-impacted soil that was below the waste but above the water table. These materials are no longer a continuing source of VOCs to the groundwater.

- **Composite liner:** Construction of the composite liner and leachate collection system provides a cap above the remaining VOC-impacted soil and groundwater in the source area. The liner includes 4 feet of compacted clay overlain by a 60-mil high density polyethylene liner. The leachate collection system includes a stone drainage layer sloped to leachate collection piping to minimize hydraulic head on the liner system. These elements reduce infiltration reaching the impacted soil and groundwater relative to the pre-waste removal conditions.

- **Underdrain:** Installation and operation of a groundwater underdrain system below the GRL liner system removes VOC-impacted groundwater from the source area. The underdrain is designed to maintain separation between the bottom of the liner and the water table, using drainage piping installed below the liner. The groundwater from the underdrain can be treated by an air stripper, if necessary, and the discharge is covered by a general Wisconsin Pollution Discharge Elimination System (WPDES) permit. Operation of the underdrain from 2016 through 2020 removed over 82 million gallons of VOC-impacted groundwater and approximately 25 pounds of VOCs. The VOC mass removal calculations for the underdrain operation are provided in **Attachment E**.

OBSERVED OR ANTICIPATED CHANGES IN SITE CONDITIONS

The major change in site conditions is the complete removal of the LGRL waste and underlying soil, and subsequent construction of the GRL Southeast Expansion in the former LGRL footprint as discussed above.

With respect to groundwater conditions (OU2), the LGRL waste relocation is anticipated to improve groundwater conditions below and downgradient from the former LGRL. This improvement will not occur immediately. The ongoing monitoring programs in the shallow and deep aquifers will continue to monitor progress toward achieving the groundwater remediation objectives. Groundwater monitoring results to date were summarized in the 2019 Annual Report dated May 29, 2020.

In the shallow aquifer monitoring well sampling, no significant short-term changes were observed that appeared to be directly related to the waste removal. The planning for the waste removal anticipated a possible short-term increase in impacts due to removing the LGRL final cover and temporarily opening up the site; however, significant increases in VOC concentrations were not observed. In general, VOC concentrations in the shallow aquifer continued to follow long-term trends. Conclusions from the 2019 Annual Report related to the shallow aquifer monitoring activities included the following:

- Consistent with previous observations, the primary CVOC plume in the shallow aquifer extends north-northeast from the north end of LGRL. CVOCs have also been detected at lower concentrations in monitoring wells adjacent to the east and south limits of the former LGRL.

- CVOC concentrations within the shallow plume continue to indicate that the overall mass of CVOCs in the groundwater has decreased with time, particularly in the source area.

- Vinyl chloride concentrations at the furthest downgradient mid-depth piezometer (MW214A) increased beginning in 2008, but now appear to have leveled off. This well nest is located approximately 1,500 feet from the downgradient property line.

In the bedrock aquifer, the only significant change that occurred during or after the LGRL waste removal was the detection of cis-1,2-dichloroethene (DCE) in samples from water supply well PW-J, which is owned by GRL and is part of the routine monitoring program for GRL. Although DCE is one of the primary CVOCs associated with the LGRL groundwater impacts, it has not been determined conclusively whether LGRL is the source of DCE at PW-J. DCE was first detected in the October 2016 sample and in 2019 and 2020 concentrations were near the NR 140 preventive action limit (PAL) of 7 micrograms per liter (µg/L), ranging from 6.8 to 8.4 µg/L. Additional investigation of the PW-J area is in progress, including geophysical logging of the well completed in 2020 and installation of one or more monitoring wells planned for 2021.

Conclusions from the 2019 Annual Report related to the bedrock groundwater investigation activities included the following:

- Groundwater flow direction in the bedrock aquifer in 2019 was to the northeast, consistent with the northeastern flow direction observed during all previous monitoring events, with the exception of October 2018.

- The lack of CVOCs in groundwater samples from monitoring well P429SS suggests that CVOC contamination in the sandstone aquifer does not extend to the northeast beyond the Andrew Oechsner property.

- Hydrogeologic and laboratory analytical data from the P424D/P424SS monitoring well nest on the All-Line property continue to support that horizontal movement of the CVOCs away from LGRL in groundwater is primarily occurring in the upper, fractured zone of the dolomite.

- Given the apparently low hydraulic conductivity of the lower portion of the dolomite and the low vertical hydraulic gradient across the lower dolomite observed at the P424 well nest, there appears to be little potential for significant vertical flow within the dolomite under ambient conditions.

- CVOC concentrations in the monitoring wells along the center of the bedrock plume, including P402E, P424D, and P423D, continue to show mostly stable or decreasing long-term concentration trends, with continuing decreasing concentrations in 2019.

- The slight increasing trend of DCE concentrations in PW-28, and the consistent presence of low concentrations of DCE in PW-19 with a slight increase in DCE in 2019, suggest that the leading edge of the dissolved CVOC plume may be continuing to migrate; however, vinyl chloride has not been detected in these wells, and the DCE concentrations remain well below the NR 140 PAL.

Tables, figures, and graphs supporting these conclusions were provided in the 2019 Annual Report. The 2020 Annual Report is currently in preparation.

EFFECT OF CHANGES TO OPERABLE UNIT 1 ON LONG-TERM PROTECTIVENESS

The LGRL waste relocation project improved the long-term protectiveness of the OU1 remedy due to several factors, including:

- Removal of 1.3 million cubic yards of municipal and industrial waste from an unlined disposal area.

- Removal of approximately 130,000 cubic yards of contaminated soil below the LGRL waste.

- Removal of an estimated 84,000 pounds of VOCs in waste and soil.

- Construction of a composite liner (60-mil HDPE geomembrane and 4 feet of compacted clay) over remaining VOC-contaminated soil, eliminating recharge

- Installation of an underdrain system below the GRL liner, providing for collection, treatment, and discharge of shallow groundwater impacted with VOCs from LGRL

With the LGRL waste entirely removed, OU1 no longer exists at the site. Remaining activities are focused on groundwater monitoring under OU2.

In recognition of the completion of source control activities under OU1 through source removal, the appropriate next step is finalization of an ESD documenting completion of the OU1 remedy of source control and indicating that only the OU2 remedy (groundwater) remains to be completed before the site can be deleted from the National Priorities List (NPL.)

Bold+underlined values exceed December 2018 NR 720 RCL for Industrial Direct Contact Pathway

Notes:
1. Analytical results for Phase A are from Construction Documentation Report, Glacier Ridge Landfill, LGRL Phase A Waste Relocation, February 2015, prepared by Cornerstone Environmental. Results taken from Appendix E and Appendix F, including the deepest samples collected at each sampling location (approximate subbase elevation or bottom of targeted supplemental excavation in the TVOC 50 area).

2. Analytical results for Phase B are from Construction Documentation Report, Glacier Ridge Landfill, LGRL Phase B Waste Relocation, October 2015, prepared by Cornerstone Environmental. Results taken from Appendix F and Appendix G, including the deepest samples collected at each sampling location (approximate subbase elevation) plus 4 additional samples from targeted supplemental excavation (SS20-SS23).

3. Analytical results for Phase C samples SS-1 to SS-27 are from Construction Documentation Report, Glacier Ridge Landfill, LGRL Phase C Waste Relocation, December 2016, prepared by Cornerstone Environmental. Results taken from Appendix E, including the deepest samples collected at each sampling location (approximate subbase elevation). Results for Phase C samples SS-28 to SS-36 (bottom of targeted supplemental investigation) are from laboratory report included in Attachment D.

NOTES:

1. TOPOGRAPHIC BASE MAP WAS COMPILED FROM THE FOLLOWING SOURCES: KBM, INC., GRAND FORKS, NORTH DAKOTA; DATES OF AERIAL PHOTOGRAPHY ARE 2012, 2011, 2003 AND OCTOBER 3, 2000; CQM TOE OF SLOPE SURVEY DATED JULY 6, 2012; WEST SEDIMENTATION BASIN FROM JUNE 2006 AS-BUILT. TOPOGRAPHIC CONTOUR INTERVAL IS TWO FEET.
2. THE GRID SYSTEM IS BASED ON W 1/4 CORNER: 30+00.00N, 30+00.00E; AND SW CORNER: 034-46.59N, 30+23.97E. BOTH IN SECTION 35, T12N, R16E, TOWN OF WILLIAMSTOWN, DODGE COUNTY, WISCONSIN (COORDINATES PROVIDED BY WELSH, HANSON & ASSOCIATES, INC., OCONOMOWOC, WISCONSIN, AND ARE BASED ON LOCAL GRID).
3. ELEVATIONS ARE BASED ON U.S.G.S. DATUM.
4. WETLAND LIMITS FROM SOUTH EXPANSION PLAN OF OPERATION EXISTING CONDITIONS MAP PREPARED BY RMT, APRIL 2005. DELINEATION BY AYRES & ASSOC. IN 2001 AND 2002. STANTEC (FORMERLY NATURAL RESOURCES CONSULTING, INC.) UPDATED THE WETLAND DELINEATION ALONG THE EAST SIDE OF GLACIER RIDGE LANDFILL AND LAND AND GAS RECLAMATION LANDFILL BETWEEN N 2850 AND S 650 IN OCTOBER 2009 AND NORTH OF N 2850 IN JULY 2010. ADDITIONAL WETLAND INFORMATION IS PROVIDED IN WETLAND PERMIT APPLICATION IN APPENDIX E OF THE SOUTHEAST EXPANSION PLAN OF OPERATION REPORT.
5. FOR WATER SUPPLY WELLS, LETTER DESIGNATIONS WERE ASSIGNED PREVIOUSLY AND USED IN REFERENCE TO WELL SETBACK EXEMPTIONS. NUMBER DESIGNATIONS WERE ASSIGNED PREVIOUSLY FOR THE PRIVATE WELL SAMPLING PROGRAM.
6. OVERHEAD AND UNDERGROUND ELECTRIC POWERLINE LOCATIONS ARE APPROXIMATE AND MUST BE VERIFIED IN THE FIELD PRIOR TO BEGINNING CONSTRUCTION ACTIVITIES.
7. FILLING OF WETLAND 1 WAS APPROVED AS PART OF THE SITE HOLISTIC PLAN AND THE SOUTH EXPANSION PERMITTING PROCESS.

- G — PROPOSED GAS HEADER
- x-x-x-x — FEATURE TO BE ABANDONED

NOTES:

1. SEE SHEET 2 FOR ADDITIONAL BASE MAP LEGEND ITEMS AND NOTES.
2. PROPOSED CONTOURS WITHIN PHASE 6 LINER CONSTRUCTION REPRESENT TOP OF INTERIM GRADES AFTER WASTE REMOVAL TO PROMOTE DRAINAGE. WASTE AND ORGANIC SOIL EXCAVATION IN THIS AREA WILL EXTEND BELOW THE INTERIM GRADES SHOWN.
3. PROPOSED CONTOURS ON 3H:1V LGRL WASTE SLOPE REPRESENT TOP OF LGRL INTERMEDIATE COVER.
4. WASTE GRADE CONTOURS AT 4H:1V AND 10H:1V SLOPES REPRESENT APPROVED/PROPOSED FINAL COVER GRADES MINUS FINAL COVER THICKNESS (5 FEET). WASTE GRADES AT 3H:1V SLOPE ARE WORKING SLOPES.
5. INTERIM GRADES SHOWN IN THE WASTE REMOVAL AREAS ARE CONCEPTUAL AND ARE INTENDED TO SHOW GENERAL DRAINAGE PATTERNS AND APPROXIMATE LENGTH OF BERM TO BE CONSTRUCTED IN ADVANCE OF THE NEXT PHASE OF LINER CONSTRUCTION. ACTUAL INTERIM GRADES MAY VARY FROM THOSE SHOWN. DEPENDING ON CONSTRUCTION SEQUENCING, INTERIM GRADES MAY NOT BE ACHIEVED THROUGHOUT THE PHASE AREA AT ONE TIME.
6. REFER TO APPENDIX M FOR ADDITIONAL MATERIAL QUANTITY INFORMATION.
7. WETLAND PROTECTION, IMPACTS, AND RESTORATION TO BE IN ACCORDANCE WITH WETLAND PERMIT ISSUED FOR CONSTRUCTION OF SOUTHEAST EXPANSION.

PHASE A WASTE REMOVAL CONSTRUCTION ACTIVITIES

1. INSTALL VIBRATING WIRE PIEZOMETERS IN EAST BERM AREA.
2. ABANDON MONITORING WELLS P5R, P303A, W13R, AND MW13AR, AND LEACHATE HEADWELLS MW2 AND MW3.
3. INSTALL TEMPORARY EROSION CONTROLS AND WETLAND PROTECTION FEATURES.
4. RELOCATE LGRL LANDFILL GAS BLOWER AND FLARE AND INSTALL PROPOSED GAS HEADER AND TEMPORARY CONDENSATE SUMP.
5. REMOVE LGRL CONDENSATE HOLDING TANK AND LOADOUT PAD.
6. DISCONNECT AND CAP LANDFILL GAS HEADER PIPING NORTH OF GAS WELLS GWL2 AND GWL12, AND INSTALL TEMPORARY CONDENSATE SUMPS.
7. REMOVE GAS WELLHEADS GWL3, GWL4, GWL5, GWL6, GWL7, GWL8, GWL13, AND GWL14.
8. STRIP VEGETATION AND TOPSOIL OVER WASTE REMOVAL AREA IN STEPS, STARTING AT TOP OF WASTE SLOPE.
9. STOCKPILE TOPSOIL.
10. REMOVE AND STOCKPILE COVER SOILS.
11. EXCAVATE WASTE IN ACCORDANCE WITH LGRL WASTE REMOVAL PLAN.
12. REMOVE DISCONNECTED GAS WELLS AND GAS PIPING AS EXPOSED AND DISPOSE IN SOUTH EXPANSION.
13. AFTER WASTE REMOVAL, LOCATE REMAINING PORTION OF MONITORING WELL P421B (ABANDONED IN PLACE) AND OVERDRILL TO REMOVE CASING.
14. AFTER WASTE REMOVAL IS COMPLETE, CONSTRUCT TEMPORARY STORM WATER MANAGEMENT FEATURES.
15. COVER EXPOSED WASTE WITH INTERMEDIATE COVER MATERIAL.
16. REMOVE ORGANIC SOILS IN EAST PERIMETER BERM AREA, INSTALL INITIAL BACKFILL, AND PERFORM VANE SHEAR TESTS IN BORINGS.
17. ESTABLISH PHASE 6 INTERIM GRADES.
18. INSTALL UNDERDRAIN TRANSFER PIPES BELOW PHASE 6 EAST BERM.
19. CONSTRUCT PORTION OF PHASE 6 EAST BERM AND DITCH.
20. PLACE TOPSOIL OVER DISTURBED AREAS.
21. SEED, FERTILIZE, AND MULCH TOPSOIL AREAS.
22. PLACE EROSION MAT IN DITCHES.

EARTHWORK QUANTITIES	VOLUME
LGRL CAP REMOVAL	
SELECT CLAY FILL	29,600 CY
GENERAL FILL	78,800 CY
TOPSOIL	9,900 CY
LGRL WASTE REMOVAL	628,000 CY

NOTES:

1. SEE SHEET 2 FOR ADDITIONAL BASE MAP LEGEND ITEMS AND NOTES.
2. PROPOSED CONTOURS WITHIN PHASE 7 LINER CONSTRUCTION AREA REPRESENT TOP OF INTERIM GRADES AFTER WASTE REMOVAL TO PROMOTE DRAINAGE. WASTE AND ORGANIC SOIL EXCAVATION IS THIS AREA WILL EXTEND BELOW THE INTERIM GRADES SHOWN.
3. PROPOSED CONTOURS ON 3H:1V LGRL WASTE SLOPE IN PHASE 8 REPRESENT TOP OF LGRL INTERMEDIATE COVER.
4. WASTE GRADE CONTOURS AT 4H:1V AND 10H:1V SLOPES REPRESENT APPROVED/PROPOSED FINAL COVER GRADES MINUS FINAL COVER THICKNESS (5 FEET). WASTE GRADES AT 3H:1V SLOPE ARE WORKING SLOPES.
5. INTERIM GRADES SHOWN IN THE WASTE REMOVAL AREAS ARE CONCEPTUAL AND ARE INTENDED TO SHOW GENERAL DRAINAGE PATTERNS AND APPROXIMATE LENGTH OF BERM TO BE CONSTRUCTED IN ADVANCE OF THE NEXT PHASE OF LINER CONSTRUCTION. ACTUAL INTERIM GRADES MAY VARY FROM THOSE SHOWN. DEPENDING ON CONSTRUCTION SEQUENCING, INTERIM GRADES MAY NOT BE ACHIEVED THROUGHOUT THE PHASE AREA AT ONE TIME.
6. REFER TO APPENDIX M FOR ADDITIONAL MATERIAL QUANTITY INFORMATION.
7. WETLAND PROTECTION, IMPACTS, AND RESTORATION TO BE IN ACCORDANCE WITH WETLAND PERMIT ISSUED FOR CONSTRUCTION OF SOUTHEAST EXPANSION.

PHASE B WASTE REMOVAL CONSTRUCTION ACTIVITIES

1. INSTALL VIBRATING WIRE PIEZOMETER IN EAST BERM AREA.
2. ABANDON MONITORING WELLS MW311R AND P311A, LEACHATE HEADWELL MW4, AND GAS PROBES GMP2, GMP3, AND GMP4.
3. INSTALL TEMPORARY EROSION CONTROLS AND WETLAND PROTECTION FEATURES.
4. DISCONNECT AND CAP LANDFILL GAS HEADER PIPING NORTH OF GAS WELLS GWL1 AND GWL10 AND RELOCATE TEMPORARY CONDENSATE SUMP ON EAST HEADER.
5. REMOVE GAS WELL HEADS GWL2, GWL9, GWL11, GWL12, AND TEMPORARY CONDENSATE SUMP ON WEST HEADER.
6. STRIP VEGETATION AND TOPSOIL OVER WASTE REMOVAL AREA IN STEPS, STARTING AT TOP OF WASTE SLOPE.
7. STOCKPILE TOPSOIL.
8. REMOVE AND STOCKPILE COVER SOILS.
9. EXCAVATE WASTE IN ACCORDANCE WITH LGRL WASTE REMOVAL PLAN.
10. REMOVE DISCONNECTED GAS WELLS AND GAS PIPING AS EXPOSED AND DISPOSE IN SOUTH/SOUTHEAST EXPANSION.
11. AFTER WASTE REMOVAL IS COMPLETE, CONSTRUCT TEMPORARY STORM WATER MANAGEMENT FEATURES.
12. COVER EXPOSED WASTE WITH INTERMEDIATE COVER MATERIAL.
13. REMOVE ORGANIC SOILS IN EAST PERIMETER BERM AREA, INSTALL INITIAL BACKFILL, AND PERFORM VANE SHEAR TESTS IN BORINGS.
14. ESTABLISH PHASE 7 INTERIM GRADES.
18. INSTALL UNDERDRAIN TRANSFER PIPES BELOW PHASE 7 EAST BERM.
19. CONSTRUCT PHASE 7 EAST BERM AND DITCH.
20. PLACE TOPSOIL OVER DISTURBED AREAS.
21. SEED, FERTILIZE, AND MULCH TOPSOIL AREAS.
22. PLACE EROSION MAT IN DITCHES.

1 INTRODUCTION

1.1 General Information

This Construction Documentation Report documents the Land and Gas Reclamation Landfill (LGRL) Phase A Waste Relocation Project. LGRL is a Superfund site, Wisconsin Department of Natural Resources (WDNR) License No. 1118, Environmental Protection Agency (EPA) ID No. WID0529060888 that is located within the approved Advanced Disposal Services (Advanced) Glacier Ridge Landfill (GRL) Southeast Expansion footprint. LGRL is located in the SW ¼ of Section 35 T12N, R16E, Town of Williamstown, Dodge County, Wisconsin.

LGRL is part of the larger Advanced GRL facility which is comprised of LGRL, the Closed North Landfill, the South Expansion and the Southeast Expansion. With the exception of LGRL all of the other landfill areas accept or accepted only municipal solid waste in accordance with Chapter NR 500 Wisconsin Administrative Code. The facility is owned and operated by Advanced Disposal Services Glacier Ridge Landfill, LLC.

1.2 Site History

LGRL is a Superfund site that began accepting waste in the 1950s and was closed in the mid-1980s. A combination of municipal solid waste, construction debris, and solvent waste were accepted at LGRL over its life. LGRL is located in the footprint of the proposed GRL Southeast Expansion. As part of the Plan of Operation for the GRL Southeast Expansion, prepared by SCS Engineers, Madison, WI (date of WDNR approval October 2013), LGRL would be removed in three phases to remediate the site and to allow for the construction of the Southeast Expansion. Phase A of the waste relocation was completed in 2014.

A plan for relocating the LGRL waste (LGRL Waste Removal Plan, Dec. 2013) was prepared as part of the Plan of Operation for the Southeast Expansion. The LGRL Waste Removal Plan was used as the basis for the relocation of the LGRL waste.

1.3 Purpose and Scope

Cornerstone was retained by Advanced to provide construction quality assurance (CQA) and oversight during Phase A of the LGRL Waste Relocation Project to ensure completion of the project in accordance with the GRL Southeast Expansion Plan of Operation, the LGRL Waste Removal Plan, and the GRL Southeast Expansion Plan of Operation WDNR Conditions of Approval.

The services provided by Cornerstone on behalf of Advanced included observation of the LGRL cover soils excavation, LGRL waste excavation, and LGRL contaminated soil excavation. The east berm construction was also observed as part of the project, the documentation for the east berm construction was submitted to the WDNR with the Phase 6 Liner Construction Documentation Report. Throughout the course of the project Cornerstone monitored the waste excavation for signs of suspect wastes as defined in the LGRL Waste Removal Plan, conducted air monitoring, collected waste, soil and water samples, and recorded daily activities during waste excavation.

This report has been prepared in accordance with Chapter NR 500 Wis. Adm. Code, Condition No. 6 of the Plan of Operation Approval Dated October 13, 2014, and includes the information required as part of the LGRL Waste Removal Plan.

2 CONSTRUCTION DOCUMENTS AND PARTIES

2.1 Reference Documents

The following reference documents were utilized during the execution of the LGRL Phase A Waste Relocation:

- Chapter NR 500 Wisconsin Administrative Code
- Chapter NR 600 Wisconsin Administrative Code
- Chapter NR 140 Wisconsin Administrative Code
- USEPA SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods"
- Southeast Expansion Conditional Plan of Operation Approval and Hazardous Waste Remediation Variance dated October 13, 2014
- Document Titled: "Land & Gas Reclamation Landfill Waste Removal Plan for Glacier Ridge Landfill Southeast Expansion" (Revision 1) prepared by SCS Engineers, Madison, WI dated December 2013.
- Document Titled: "Plan of Operation – Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated April 23, 2013.
- Document Titled: "Plan of Operation Addendum No. 1 - Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated June 28, 2013.
- Document Titled: "Plan of Operation Addendum No. 2 - Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated October 3, 2013.

2.2 Parties

The following parties were involved in the LGRL Phase A Waste Relocation:

<u>Wisconsin Department of Natural Resources (WDNR)</u>

Ann Bekta, P.E. – Waste Management Engineer

Adam Hogan, P.G. – Hydrogeologist

Will (Woody) Myers – Hydrogeologist

Advanced Disposal Glacier Ridge Landfill, LLC

Jay Warzinski – Corporate Director of Landfill Operations

Doug Coenen – Regional Landfill Operations Manager

Lonn Walter – General Manager

Jake Margelofsky – Operations Manager

Cornerstone Environmental Group, LLC (Project Management /CQA)

Joe Falle, P.E. – Certifying Engineer / Project Manager

Jason Whitman - Project Technician

SCS Engineers, Inc. (Design Engineer)

Sherren Clark, P.E., P.G. – Design Engineer Project Manager

Hoffman Construction Company (General Contractor)

Chad Sell –Project Manager

Jay Kahl – Project Superintendent

CQM, Incorporated (Survey, Physical Soil Analysis)

Nick Sturzl, P.E. – Project Manager

Aaron Shroeder, R.L.S. – Surveyor

Rick Wiemann – Project Technician

PACE Analytical (Soil/Waste/Liquid Analytical Laboratory)

Dan Milewsky – Project Manager

Air Technology Laboratories, Inc. (Air Sample Analytical Laboratory)

Joann De La Ossa – Project Manager

3 EROSION CONTROL AND WETLAND PROTECTION

Prior to construction startup, erosion control measures were installed to protect the wetland areas to the north and east of the LGRL Phase A Excavation Area. The wetland protection included the protection provisions specified in the Wetland Protection and Erosion Control Plan. The Wetland Protection and Erosion Control Plan was included in Appendix E of the Southeast Expansion Plan of Operation. At the beginning of the project steel backed silt fence with a warning ribbon was installed prior to any construction commencing. The silt fence was installed along the approved line as specified in the Plan of Operation and as shown on Drawing No. 3 of the attached plan set. On a weekly basis, the project technician inspected the silt fence and recorded the results on wetland inspection forms. The wetland inspection forms are included in Appendix A.

No work occurred in the wetland outside of the predetermined boundaries specified in the Wetland Protection and Erosion Control Plan. In addition, during construction all non-contact surface water runoff was directed to Sedimentation Basin No.2 located to the north of the LGRL Phase A Excavation Area.

4 COVER SOIL EXCAVATION

Prior to performing waste excavation activities, the cover soils on top of the waste removed. The cap consisted of the following layers from top to bottom:

- Vegetative layer
- 6-inch topsoil layer
- Rooting zone layer (variable depth, 24 inches min.)
- 24-inch clay layer
- Grading Layer (variable depth, min. 6 inches)

During excavation efforts were made to segregate the different cover soils, however due to the abnormally cold winter and excessive frost depth it was difficult to separate the topsoil and rooting zone. As such, topsoil and rooting zone were excavated simultaneously and stockpiled for use as daily / intermediate cover on the active landfill. Clay was able to be segregated and stockpiled for future use in construction of the Phase 6 Liner North Perimeter Berm. Soils that were within 6 inches of the waste were not segregated and were treated as waste in accordance with the LGRL Waste Removal Plan.

5 LANDFILL GAS SYSTEM ABANDONMENT/FLARE RELOCATION

5.1 LFG Well and Piping Abandonment

LGRL contains an active gas extraction system. Prior to construction, a total of 14 vertical landfill gas (LFG) extraction wells were in place and operational. Each of the wells was connected to a blower flare station located at the northwest corner of LGRL. As part of the Phase A waste relocation a total of eight existing vertical wells were abandoned along with associated lateral and header piping. The eight wells were GWL3, GWL4, GWL5, GWL6, GWL7, GWL8, GWL13, and GWL14 Wells and piping were removed as the waste was excavated. All well and lateral components were disposed of in the active GRL.

5.2 Blower / Flare Relocation

Six of 14 existing vertical LFG extraction wells and associated piping remained in place after the completion of the LGRL Phase A Waste Relocation. Due to the need to keep the system active, the blower/flare system was required to be operated until such time that the remaining gas wells would be removed. The blower/flare system was originally located at the northwest corner of LGRL which was in the excavation area. As part of the Phase A project, the blower/flare system was relocated to south end of LGRL as shown on Drawing No. 4. Due to the reduced gas flows at LGRL the blower/flare only runs intermittently when gas with a high enough Btu content is available to burn.

5.3 LFG Condensate Management

Prior to the LGRL Phase A Waste Relocation project, all condensate drained in the gas header pipes by gravity to the northwest corner of the site where it was stored in a 5,000 gallon underground storage tank. The storage tank was periodically pumped out and the condensate was commingled with leachate for offsite disposal. The existing storage tank was removed and disposed of in the GRL. The existing header and lateral pipes are sloped such that they drain from the south to the north. To accommodate condensate that would be generated after the Phase A project was completed, three temporary condensate sumps were installed. Two of the condensate sumps were placed at the termination points of the header pipe as shown on Drawing No. 4. The sumps are designed to provide a vacuum break and drain the condensate back into the LGRL waste (see Detail 5 on Drawing No. 6) The third condensate sump was installed upstream of the blower/flare system to protect the blower from condensate. This sump is periodically pumped out using a tanker truck and the condensate is combined with the GRL leachate in the leachate storage tanks.

6 MONITORING WELL ABANDONMENT

6.1 Non-Groundwater Well Abandonments

As part of the Phase A Waste Relocation project, two vertical leachate head wells MW-2 and MW-3, which were located within the LGRL Waste Limits, were abandoned. Abandonment included removal of the casing pipe with the excavation of waste. No borehole abandonment was required because the head wells did not extend past the bottom of waste. The casing pipes were disposed of in the active GRL.

6.2 Groundwater Well Abandonments

Several groundwater monitoring wells required abandonment as part of the Phase A Waste Relocation project to allow for the construction of the Phase 6 Composite Liner. A total of five groundwater monitoring wells were abandoned, one that was in the waste and four that were outside of the waste. The wells abandoned were:

- MW13AR
- MW13R
- P303A
- P5R
- P421B (inside waste limits)

All of the wells were over drilled, the casings and screens were removed, and the boreholes backfilled in accordance with Chapter NR 141 Wis. Adm. Code. Well Abandonment Forms are included in Appendix C.

7 WASTE EXCAVATION

7.1 Introduction

Excavation of LGRL Waste began on March 10, 2014 and was completed by July 18, 2014. This section details the site health and safety, environmental monitoring and protection, waste handling, screening and characterization methods, quantities and types of waste removed, details of waste handling and screening procedures, and details of suspicious waste removal and handling.

7.2 Environmental Monitoring / Protection

The LGRL Waste Removal Plan specified environmental monitoring and protection methods that were required in association with waste excavation and relocation activities. The required environmental monitoring / environmental protection items included:

- Ambient Air Monitoring
- Dust and Odor Control
- Surface Water Management
- Waste Contact Water Management

Each of the above items is discussed in the sections below.

7.2.1 Ambient Air Monitoring

Section 4.5.1 of the LGRL Waste Removal Plan required that ambient air-monitoring be conducted both on and off site at upwind and downwind locations. Ambient air monitoring was to be conducted weekly for the first six weeks and if no contaminants were discovered, biweekly thereafter. The main constituents of concern were volatile organic compounds (VOCs). During the project a total of 44 ambient air samples were collected. Samples were collected using Silco Cans that were put under a vacuum in the lab. Each can was fitted with a regulator that allowed for continuous sample collection over an approximately 8-hour period. A total of four samples were required for each sampling event per the LGRL Waste Removal Plan: one upwind, one in the public drop off area, and two downwind. An additional sample was added at the working face of the LGRL landfill to assess the VOC concentrations within the waste itself. This was done as a safety precaution for workers that were consistently present in or near the waste.

During sampling, weather conditions such as temperature, precipitation, barometric pressure, pressure trend, wind speed, and wind direction were recorded with each

sampling event. Samples were not collected when sustained winds over 15 miles per hour (mph) were present.

Following collection samples were shipped to Air Technologies Laboratories (ATL) in the City of Industry, California. ATL analyzed each of the samples for VOCs in accordance with EPA Method TO 14/15.

Appendix D of the report includes sample locations, summarizes sample detections, and includes the lab reports from the laboratory. Sample detections were compared to OSHA permissible exposure limits (PELs) as is shown in Appendix D. All of the constituents that were detected were well below the OSHA PELs. Due to the low concentrations of VOCs that were detected, it is difficult to state whether the VOCs that were detected were from the waste, vehicle exhaust, or to other activities on or off the site.

Samples were to be collected weekly for the first 6 weeks of the project, however week number 2 was missed. The reason week number 2 was missed was related to a shipping issue with the sampling equipment. If clean results were obtained, sampling could be reduced to biweekly per the LGRL Waste Removal Plan. Sampled dates are summarized below:

Week 1: 3/4/2014
Week 2: Missed
Week 3: 3/18/14
Week 4: 3/21/14
Week 5: 3/28/14
Week 6: 4/9/14, 4/10/14, 4/11/14
Week 8: 4/25/14
Week 10: 5/16/14
Week 12: 6/5/14

After June 5, 2014, some waste remained in place, however, large amounts of rain were received at the site that delayed the removal of the last remaining waste volumes for several weeks. No additional air samples were completed after June 5, 2014 due to the small amount of waste that remained and the fact that previous sample results had VOC concentrations well below the OHSA permitted levels.

Based on the results obtained from the air monitoring sample analyses, no apparent threat to the environment or human health due airborne VOCs was noted during the project.

7.2.2 Dust and Odor Control Measures

Throughout the excavation process dust was controlled by watering haul roads, and if necessary, the waste excavation area. Watering of roads was completed on an as needed

basis to control dust. During days when dust control was required, roads were watered several times per day to mitigate dust on site haul roads.

At the beginning of the excavation process, it was unknown how strong odors would be. As a preventative measure, Advanced employed the use of odor control devices that utilize odor neutralizing agents mixed with water. The first system installed was a temporary system that utilized sprayers that were mounted on fence posts. The fence posts were installed at roughly 15 foot intervals and interconnected with hydraulic hose. A small pump transferred water and odor neutralizing agent through the hose to the nozzles. This system was utilized until a portable trailer mounted system could be delivered to the site. The portable trailer mounted system consisted of a trailer mounted 1,000 gallon water tank, spray bars, and pump. Water and odor neutralizing agent were pumped from the tank to the spray bars where a fine mist was produced. The portable system was used for the second half of the project. The trailer mounted system could more easily be moved to areas that had higher odor concentrations. Photos of the odor control systems in use are presented in Appendix B.

Fortunately odors were not excessive during the project and rarely migrated off site. The odor systems were run continuously after installation to prevent odors from migrating offsite.

7.2.3 Surface Water Management

During waste excavation the clean runoff water was prevented from entering the excavation area. The main method used to prevent clean runoff from entering the excavation was grading around the excavation to divert surface water away from the working face. Surface water that did contact waste was managed as leachate as is detailed in Section 7.2.4.

7.2.4 Contact Water / Leachate Management

Water that contacted waste or contaminated soils was treated as leachate. To prevent the migration of contact water off site, the excavation was graded to a low point where contact water could drain. The low point consisted of a collection sump and pump station that was used to transfer the contact water to leachate trucks. All contact water was treated as leachate and taken off site for disposal at a wastewater treatment plants (WWTP). Prior to transporting water to the treatment plant, leachate samples were taken and analyzed at a laboratory. The results of the lab samples were shared with the WWTP's that accepted leachate to verify their permit limits would not be exceeded. The WWTP's had no issues accepting leachate during the project. During the project the total volume of leachate taken off site from the excavation was approximately 900,000 gallons.

7.2.5 Groundwater Dewatering

During the excavation of the waste and the construction of the east perimeter berm, groundwater dewatering did not occur. Small amounts of water were encountered during soft soil excavation, but this water did not warrant pumping or dewatering. As such, no groundwater was treated or sampled during the LGRL Phase A Waste Relocation project.

7.3 Waste Handling, Screening and Characterization

Waste handling, screening and characterization procedures are specified in Section 4 of the LGRL Waste Removal Plan. The LGRL Waste Removal Plan identified four major waste categories as listed below:

- Typical waste (municipal and industrial)
- Salvageable waste
- Suspicious waste
- Hazardous waste

During the excavation process, the Cornerstone Field Technician screened and characterized the waste removed through visual observations, odor observations and performed periodic readings with a Photo Ionization Detector (PID) to identify suspicious and potentially hazardous wastes. The waste screening process and subsequent handling process is described in the sections below.

7.3.1 Typical Waste

Waste was classified as typical waste if it exhibited the following characteristics:

- The waste resembled MSW or waste typically disposed of in GRL
- The waste did not exhibit solvent odor
- The waste did not exhibit positive PID readings

The majority of the waste exhumed from LGRL was classified as typical waste.

Hoffman Construction Company (Hoffman) used two CAT 385 Excavators to load between eight and ten articulated 40 ton haul trucks daily. The excavators loaded the LGRL waste into the haul trucks, and the haul trucks transported the waste to the active GRL. Typical waste was dumped in the active area and was spread utilizing CAT D8 dozers and the landfill's compactors. LGRL was either commingled with incoming waste or was mono-filled. At times it was difficult to commingle excavated LGRL waste with incoming MSW due to safety and traffic pattern concerns. Waste within GRL was covered on a daily basis with alternate daily cover (ADC) or soil materials. Waste that was placed on outboard

slopes was covered with one foot of intermediate cover soil after placement. The minimum separation distance between the leachate drainage layer and the LGRL waste was 15 feet.

7.3.2 Salvageable Waste

Salvageable waste was not identified during the waste screening and characterization. As such no waste was salvaged as part of the Phase A Waste Removal.

7.3.3 Suspicious Waste

Suspicious wastes were identified through visual and odor observations, and by screening the waste with a photoionization detector (PID). All workers and equipment operators that were continually in the waste excavation area wore personal gas detection meters that had PID capability. The meters were utilized for worker health and safety primarily, but were also utilized to detect potentially VOC contaminated waste. The LGRL Waste Removal Plan did not specify a VOC concentration determined in the field that would in turn characterize the waste as suspicious. Discussions were conducted with the WDNR regarding the lack of a VOC concentration specifications for treating waste in the field. Through the discussions with the WDNR, if a VOC reading of the 10 ppm was detected with the PID, the waste would be characterized as suspicious and further testing would be required. The basis for the 10 ppm limit is from the LGRL Waste Removal Plan Soil Management Section. Section 6.2.2 of the LGRL Waste Removal Plan specified a VOC concentration of 10 ppm for soil found within the waste to determine the use for the soil. Since this was used for the soil within the waste, it was determined that this standard could also apply to suspicious waste. Equipment operators and the Cornerstone Field Technician also visually observed the excavation for the presence of intact drums, transformers, and other containers that may have housed suspicious waste. No intact drums, containers, or transformers were found during the excavation.

Suspicious waste was identified on three different occasions, March 8, 2014, May 9, 2014 and July 16, 2015 . The suspicious waste was identified based on the field PID screenings conducted by the Cornerstone field technician. All suspicious waste identified met the criteria of bulk suspicious waste which was waste that did not meet the criteria for intact drums or transformers. When the bulk suspicious waste was identified, excavation in the area ceased and the Cornerstone field technician identified the area that was classified as suspicious. In each case, the suspicious waste was excavated from the area until passing PID (<10 ppm) results were obtained. The waste removed on July 16, 2015 was near the bottom of the excavation and was removed until soil was visible. The suspicious waste that was found on July 16, 2015 was directly above soil sample 50. Sample 50 is described in Section 8.3.4. The suspicious waste was transported to the GRL lined area and stockpiled away from other waste placement activities. Samples of the waste were collected and sent to PACE Analytical where it was tested for total VOCs. While awaiting the results of the VOC analysis, the bulk suspicious waste was covered with soil or ADC materials. The total

VOC analysis results were compared to the Toxicity Characteristic Leaching Procedure (TCLP) limits utilizing the 20 times rule. If the total VOC concentrations for bulk suspicious wastes were less than 20 times the TCLP limit the TCLP limit was considered met and the waste was disposed of with the other incoming LGRL waste. None of the suspicious wastes encountered exceeded the TCLP limits and were not determined to be hazardous. As such, all suspicious wastes were incorporated into the GRL waste. Results of the special waste tests are presented in Appendix E. The total volume of suspicious waste removed from the Phase A area was 4 loads, or approximately 120 cubic yards.

7.3.4 Hazardous Waste

No hazardous waste was identified through the screening procedures described in the LGRL waste removal plan.

7.4 Waste Types and Quantities

As noted above the majority of waste that was excavated in the Phase A area was disposed of in the GRL as typical waste. Some bulk suspicious waste was identified as during the waste screening and characterization. All bulk suspicious wastes were tested in the laboratory for total VOCs and met the minimum disposal requirements for disposal in GRL. No hazardous wastes were identified. The total volume of waste removed is as follows:

- Typical Waste = 584,394 cubic yards (CY)
- Bulk Suspicious Waste = 120 cubic yards (CY)

8 SOIL EXCAVATION

8.1 Introduction

Soil excavation followed the Soil Management Plan included as in Section 6 of the LGRL Waste Removal Plan. Soils that were excavated generally consisted of cover soils, soils within the waste, berms, and native soil underlying the waste. Soil was classified in accordance with the LGRL Waste Removal Plan and used for beneficial reuse, disposed of or treated. The following sections detail the soil excavation from the site.

8.2 Soil Types

The LGRL Waste Removal Plan identified four different types of soils. Soils removed from LGRL were classified into one of the four types described below based on contamination levels. The LGRL Waste Removal Plan identified how each type of soil was to be managed. The soil types identified in the LGRL Waste Removal Plan are as follows (see the LGRL Waste Removal Plan for more detailed descriptions):

- Type 1 – Soil that is not impacted above soil standards. Type 1 soil could be used anywhere on the site. To confirm soil could be classified as Type 1, it was tested in the lab for Lead, Cadmium, and VOCs. PCB Testing was not completed as the soils did not contain potentially PCB laden equipment or materials. If soil was not impacted above the soil residual contaminant level established under NR 720, the soil could be utilized on site without restrictions.
- Type 2 – Soil that was impacted and may contain contaminants above the NR 720 RCLs but below the TCLP limits. Type 2 soil could be used within the lined area of the landfill as daily cover. Type 2 soils did not require laboratory testing to be used in the footprint or disposed of as waste unless they were identified as suspicious wastes.
- Type 3 – Soil that is impacted and may contain contaminants above the NR 720 RCLs for direct contact but are below the groundwater standards. Type 3 soils were not identified during the project.
- Type 4 – Soil that exceeds the TCLP limits and must be treated prior to disposal. Type 4 soils were not identified during the project.

8.3 Soil Sampling, Analysis and Classification

Several different soils were encountered during the excavation of the LGRL waste and included cover soils, soil within the waste, soil between the bottom of waste and Phase 6 Subbase, and additional soils excavated for remediation. Each of the soils excavated are described in detail in the following sections:

8.3.1 LGRL Final Cover Soils

As was discussed in Section 6.2.1 of the LGRL Waste Removal Plan, final cover soils could be classified as Type 1 soils unless they were observed to be in direct contact with waste or exhibited other characteristics such as staining or odor. Soils that were within 6 inches of the waste were treated as waste and disposed of. Detailed cover soil excavation and stockpiling is discussed in Section 4 of this report.

8.3.2 Soil Within the LGRL Waste

Soil within the LGRL waste mass was treated entirely as waste. Based on the observations during the excavation it was not practical to separate soil from waste and as such the soil was not tested for reuse. Soil within the waste was only tested if it was part of a suspicious waste observation as detailed in Section 7 of this report.

8.3.3 Soil Between the Bottom of LGRL Waste and Above Phase 6 Liner Subbase Grades

The bottom of the LGRL waste was above the proposed subbase grades for the Phase 6 composite liner. Soil in this region required excavation to achieve the subbase grades and was required to be tested if used outside of the GRL footprint. Soil depths in this region ranged from 0 to 7 feet with an average depth of approximately 5 feet. During waste excavation, soil that was visually stained by the waste was treated as waste and disposed of in the GRL active area. The depth of soil that was removed and disposed of was generally between 1 and 2 feet below the bottom of the waste.

The soil that remained was tested to determine where the soil could be utilized. Testing consisted of dividing the site into approximately 0.5 acre subareas where test pits were dug to test the underlying soils. Samples were collected at each of the test pit locations and analyzed for VOCs, Cadmium and Lead. Figure 1 in Appendix F shows the location of the test pits.

The soil test results were compared to NR 720 RCLs for groundwater and direct contact, TCLP limts, and NR 668 Universal Treatment Standards (UTS). A summary of the data is presented in Appendix F. There were several exceedances for various contaminants as shown in the summary of the data. Soil that did not meet the limits for use outside of the GRL footprint was disposed of or used as daily cover within the limits of waste. A total of 8,497 cubic yards of contaminated soil was disposed of in the active GRL.

8.3.4 Additional Soil Excavation for Remediation

As part of the LGRL Waste Relocation plan, a soil remediation plan was put into place that required removal of soils from below the Southeast Expansion subbase grades. A total of 3,000 cubic yards of soil could be removed for remediation across the entire LGRL area.

After all of the LGRL waste had been removed from the Phase A area, the subbase was inspected for areas that had high levels of VOC contamination. There was one area that was found within the LGRL waste that contained VOC levels that warranted additional investigation. The area was centered around TVOC Test Number 50 as indicated in Figure 2 in Appendix G. Test 50 was located in the City of Mayville Dump Area. Preliminary test pits were dug to determine the level of contamination. A PID was used to estimate VOC concentrations, PID readings indicated VOC contamination levels above 400 ppm.

The WDNR was informed of the area of VOC contamination. Advanced Disposal and the WDNR collaborated to determine a course of action for removing the soil. The bullet points below describe the methods used to bound the area and remove the contaminated soil.

- First, additional test pits were dug surrounding the center of the VOC contamination. Figure 2 shows a simple diagram as to how the test pit locations were determined. A total of 8 additional test pits were dug and soil samples were obtained to determine the level of contamination at each test pits. The test pits were located between the center of the VOC contamination and previous test points that had VOC contamination below acceptable limits.
- After performing the tests at the additional locations, Advanced Disposal and Cornerstone consulted with the WDNR to determine a plan for removal of the impacted soil. The location of the additional soil tests were used to bound the approximate area of contamination. Results of the additional soil sample laboratory tests are summarized in Appendix G. During excavation of the contaminated soil, a PID was used to assess the level of contamination in the soil that was removed along with determining the stopping points of the excavation.
- Figure 2 shows the area of soil that was removed below the subbase grades. The total volume of soil removed was approximately 570 cubic yards. Additional tests of the relocated soil were taken after it was moved to the GRL where it was segregated. The additional tests indicated levels of contamination within the soil was above the limits for disposal in GRL.
- The impacted soil was relocated to the GRL Biopile. The Biopile utilizes a blower to infuse air into the soil and volatilize the VOCs. At the time of this report the soil continues in remediation. The soil will continue in remediation in accordance with the GRL approved Biopile Plan. Upon completion of the remediation, reports will be sent to the WDNR in accordance with approved Biopile Plan.

9 EAST BERM CONSTRUCTION / UNDERDRAIN TRANSFER CONSTRUCTION

The East Berm and Underdrain Transfer system construction was presented in the Phase 6 Liner Construction Documentation Report Addendum No. 1 dated January 23, 2015.

10 CONCLUSION

The LGRL Phase A Waste Relocation project has been completed in accordance with the approved Plan of Operation, the construction plans and specifications, Chapters NR 500, 600 and 700 Wis. Adm. Code. On behalf of Advanced Disposal, Cornerstone respectfully requests the review and approval of this Construction Documentation Report.

1 INTRODUCTION

1.1 General Information

This Construction Documentation Report documents the Land and Gas Reclamation Landfill (LGRL) Phase B Waste Relocation Project. LGRL is a Superfund site, Wisconsin Department of Natural Resources (WDNR) License No. 1118, Environmental Protection Agency (EPA) ID No. WID0529060888 that is located within the approved Advanced Disposal Services (Advanced) Glacier Ridge Landfill (GRL) Southeast Expansion footprint. LGRL is located in the SW ¼ of Section 35 T12N, R16E, Town of Williamstown, Dodge County, Wisconsin.

LGRL is part of the larger Advanced GRL facility which is comprised of LGRL, the Closed North Landfill, the South Expansion and the Southeast Expansion. With the exception of LGRL all of the other landfill areas accept or accepted only municipal solid waste in accordance with Chapter NR 500 Wisconsin Administrative Code. The facility is owned and operated by Advanced Disposal Services Glacier Ridge Landfill, LLC.

1.2 Site History

LGRL is a Superfund site that began accepting waste in the 1950s and was closed in the mid-1980s. A combination of municipal solid waste, construction debris, and solvent waste were accepted at LGRL over its life. LGRL is located in the footprint of the proposed GRL Southeast Expansion. As part of the Plan of Operation for the GRL Southeast Expansion, prepared by SCS Engineers, Madison, WI (date of WDNR approval October 2013), LGRL would be removed in three phases to remediate the site and to allow for the construction of the Southeast Expansion. Phase A of the waste relocation was completed in 2014, while Phase B was completed in May 2015.

A plan for relocating the LGRL waste (LGRL Waste Removal Plan, Dec. 2013) was prepared as part of the Plan of Operation for the Southeast Expansion. The LGRL Waste Removal Plan was used as the basis for the relocation of the LGRL waste.

1.3 Purpose and Scope

CQM, Inc. was retained by Advanced to provide construction quality assurance (CQA) and oversight during Phase B of the LGRL Waste Relocation Project to ensure completion of the project in accordance with the GRL Southeast Expansion Plan of Operation, the LGRL Waste Removal Plan, and the GRL Southeast Expansion Plan of Operation WDNR Conditions of Approval. Cornerstone provided construction management and overall project oversight during the project.

The services provided by Cornerstone and CQM, Inc. on behalf of Advanced included observation of the LGRL cover soils excavation, LGRL waste excavation, and LGRL contaminated soil excavation. Portions of the east berm construction were also observed as part of the project, the documentation for the east berm construction has been submitted to the WDNR with the Phase 7 Liner Construction Documentation Report. Throughout the course of the project CQM monitored the waste excavation for signs of suspect wastes as defined in the LGRL Waste Removal Plan, conducted air monitoring, collected waste, soil and water samples, and recorded daily activities during waste excavation.

This report has been prepared in accordance with Chapter NR 500 Wis. Adm. Code, Condition No. 6 of the Plan of Operation Approval Dated October 13, 2014, and includes the information required as part of the LGRL Waste Removal Plan.

2 CONSTRUCTION DOCUMENTS AND PARTIES

2.1 Reference Documents

The following reference documents were utilized during the execution of the LGRL Phase B Waste Relocation:

- Chapter NR 500 Wisconsin Administrative Code
- Chapter NR 600 Wisconsin Administrative Code
- Chapter NR 140 Wisconsin Administrative Code
- USEPA SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods"
- Southeast Expansion Conditional Plan of Operation Approval and Hazardous Waste Remediation Variance dated October 13, 2014
- Document Titled: "Land & Gas Reclamation Landfill Waste Removal Plan for Glacier Ridge Landfill Southeast Expansion" (Revision 1) prepared by SCS Engineers, Madison, WI dated December 2013.
- Document Titled: "Plan of Operation – Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated April 23, 2013.
- Document Titled: "Plan of Operation Addendum No. 1 - Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated June 28, 2013.
- Document Titled: "Plan of Operation Addendum No. 2 - Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated October 3, 2013.

2.2 Parties

The following parties were involved in the LGRL Phase B Waste Relocation:

Wisconsin Department of Natural Resources (WDNR)

Ann Bekta, P.E. – Waste Management Engineer

Adam Hogan, P.G. – Hydrogeologist

Will (Woody) Myers – Hydrogeologist

Advanced Disposal Glacier Ridge Landfill, LLC

Jay Warzinski – Corporate Director of Landfill Operations

Doug Coenen – Regional Landfill Operations Manager

Lonn Walter – General Manager

Jake Margelofsky – Operations Manager

Cornerstone Environmental Group, LLC (Project Management)

Joe Falle, P.E. – Project Manager

Mark Torresani, P.E. – Certifying Engineer

CQM, Incorporated (Survey, Physical Soil Analysis)

Nick Sturzl, P.E. – Project Manager

Rick Wiemann – Project Technician

Austin Field – Project Technician

Tom Bishop – Project Technician

SCS Engineers, Inc. (Design Engineer)

Sherren Clark, P.E., P.G. – Design Engineer Project Manager

Mashuda Contractors, Inc (General Contractor)

Stacey Krueger – Project Manager

George Reynolds – Project Superintendent

Mike Burt – Project Superintendent

PACE Analytical (Soil/Waste/Liquid Analytical Laboratory)

Dan Milewsky – Project Manager

Air Technology Laboratories, Inc. (Air Sample Analytical Laboratory)

Joann De La Ossa – Project Manager

Malter Associates, Inc. (Industrial Hygienist)

Dave Malter – President

Veolia Environmental Services – Industrial Services (Field Testing of Air and Soil Samples)

Jon Borkenhagen – Response Manager

3 EROSION CONTROL AND WETLAND PROTECTION

Prior to construction startup, erosion control measures were installed to protect the wetland areas to the east of the LGRL Phase B Excavation Area. The wetland protection included the protection provisions specified in the Wetland Protection and Erosion Control Plan. The Wetland Protection and Erosion Control Plan was included in Appendix E of the Southeast Expansion Plan of Operation. At the beginning of the project wire backed silt fence with a warning ribbon was installed prior to any construction commencing. The silt fence was installed along the approved line as specified in the Plan of Operation, directed by the WDNR and as shown on Drawing No. 5 of the attached plan set. On a weekly basis, the project technician inspected the silt fence and recorded the results on wetland inspection forms. The wetland inspection forms are included in Appendix A.

No work occurred in the wetland outside of the predetermined boundaries specified in the Wetland Protection and Erosion Control Plan. During construction all non-contact surface water runoff was directed to Sedimentation Basin No.2 located to the north of the LGRL Phase B Excavation Area. All precipitation and stormwater runoff that came into contact with waste or contaminated soils was contained in the area of the excavation, collected and routed or hauled to the leachate collection system for subsequent treatment. No contact water was allowed to enter the wetlands.

4 COVER SOIL EXCAVATION

Prior to performing waste excavation activities, the cover soils on top of the waste were removed. The cap consisted of the following layers from top to bottom:

- Vegetative layer
- 6-inch topsoil layer
- Rooting zone layer (variable depth, 24 inches min.)
- 24-inch clay layer
- Grading Layer (variable depth, min. 6 inches)

A large portion of the topsoil and rooting zone layers were excavated during 2014. These soils were utilized to construct portions of the perimeter berm for the Phase 6 Liner Project. Clay soils were kept intact until just prior to the excavation of the Phase B Waste.

Efforts were made to segregate soils during the remainder of the excavation. Topsoil was stockpiled for future projects, rooting zone was stockpiled or used for daily cover and clay was segregated and stockpiled for future use to the north of the LGRL facility. Soils that were within 6 inches of the waste or that were too frozen to separate from the underlying waste were not segregated and were treated as waste in accordance with the LGRL Waste Removal Plan.

5 LANDFILL GAS SYSTEM ABANDONMENT

5.1 LFG Well and Piping Abandonment

LGRL contains an active gas extraction system. During the Phase A Waste Excavation project, eight wells were abandoned and the blower/flare station was relocated (see Drawing No. 5). Prior to the Phase B construction, a total of six (6) vertical landfill gas (LFG) extraction wells were still in place and operational. Each of the wells was connected to the blower flare station located at the south end of LGRL. As part of the Phase B waste relocation a total of four (4) existing vertical wells were abandoned along with associated lateral and header piping. The four (4) wells were GWL, GWL9, GWL11, and GWL12. Wells and piping were removed as the waste was excavated. All well and lateral components were disposed of in the active GRL.

5.2 Blower / Flare System

Two vertical LFG extraction wells and associated piping remained in place after the completion of the LGRL Phase B Waste Relocation. Due to the need to keep the system active, the blower/flare system was required to be operated until such time that the remaining gas wells would be removed or the WDNR approved decommissioning of the blower/flare system. Due to the reduced gas flows at LGRL the blower/flare only runs intermittently when gas with a high enough Btu content is available to burn. Advanced has received approval to abandon the remaining LGRL gas extraction and blower/flare system once Phase C waste relocation activities begin.

5.3 LFG Condensate Management

Two temporary condensate management sumps CS-2 and CS-3 were abandoned as part of the Phase B Waste Excavation. The only remaining condensate management structure on site is the CS-1 sump which is located in line with the blower flare station. This condensate sump will remain until such time that the wells are abandoned or the system is decommissioned as part of the Phase C LGRL waste relocation.

6 MONITORING WELL ABANDONMENT

6.1 Non-Groundwater Well Abandonments

As part of the Phase B Waste Relocation project, one vertical leachate headwell MW-4, which was located within the LGRL Waste Limits, was abandoned. In addition to the leachate headwell, four gas probes (GMP-1 through GMP-4) were abandoned. Each of the probes were located within the LGRL waste limits. Abandonment included removal of the casing pipes with the excavation of waste. No borehole abandonment was required because neither the headwell nor the gas probes extend past the bottom of waste. The casing pipes were disposed of in the active GRL. Drawing No. 5 shows the location of the abandoned monitoring devices.

6.2 Groundwater Well Abandonments

Two groundwater monitoring wells required abandonment as part of the Phase B Waste Relocation project to allow for the construction of the Phase 7 Composite Liner. The wells abandoned were:

- MW311R
- P311A

All of the wells were over drilled, the casings and screens were removed, and the boreholes backfilled in accordance with Chapter NR 141 Wis. Adm. Code. Well Abandonment Forms are included in Appendix C.

7 WASTE EXCAVATION

7.1 Introduction

Excavation of LGRL Waste began on February 3, 2015 and was completed by May 5, 2015. This section details the site health and safety, environmental monitoring and protection, waste handling, screening and characterization methods, quantities and types of waste removed, details of waste handling and screening procedures, and details of suspicious waste removal and handling.

7.2 Site Health and Safety

There were two instances in which site health and safety issues were encountered during the waste excavation.

7.2.1 Health and Safety Issue February 2015

The first health and safety issue occurred on February 12, 2015. Several of the workers complained of symptoms that included but were not necessarily limited to; bloody noses, tiredness, sore throat, coughing, eye irritation, and chest pain/congestion. When Advanced and Cornerstone were informed of this, work was immediately stopped on site until further investigation could be conducted. As a starting point, interviews were conducted with the personnel that experienced symptoms. In addition, data from the workers' personal gas meters was collected and analyzed. Finally, as an added protection Veolia Special Services (Veolia) was contacted to complete additional VOC, chlorine and ammonia monitoring. The results of the Veolia monitoring did not indicate anything outside of what was to be expected or concern for workers health and safety.

Results of the interviews and personal detection meters were sent to an outside industry hygiene company, Malter Associates, Inc. (Dallas, TX). Malter Associates reviewed the data collected by Advanced and Cornerstone and interviewed some of the workers as well. The opinion of Malter Associates was that a chemical reaction occurred and released a short burst of ammonia or something similar that caused the workers' symptoms.

In addition to rendering an opinion, Malter developed additional safety procedures and recommended that the workers wear sampling badges that could detect VOCs, ammonia, chlorine and sulfur compounds. The workers wore the sampling badges over the entire work day to get a representative sample. Results of the sample analysis indicated that none of the compounds detected were above OSHA limits.

During the remainder of the waste relocation portion of the project, no other instances occurred that required additional sampling or additional PPE.

7.2.2 Health and Safety Issue May 2015

On May 6, 2015 another health and safety issue occurred. This occurrence was related to the excavation of the contaminated soil after all waste had been removed. Workers were complaining of strong solvent odor and handheld PID readings were between 10 and 100 ppm. In some areas the PID read in excess of 100 ppm. Malter Associates was contacted for an outside opinion on the situation. Malter recommended respirator use until personal badge testing indicated there was no issue and that all VOC levels were below OSHA limits.

Workers were fitted with badges during their work day and the badges were sent to the lab for analysis. While the badges were worn and until results were received, workers and CQA staff wore respirators fitted with organic vapor/ammonia/particulate cartridges. Analysis of the badge testing indicated that no OSHA limits were exceeded. As a precaution, when VOC levels in the cabs increased above 10 ppm workers wore respirators. In addition, all ground personnel wore respirators at all times during contaminated soil excavation.

7.3 Environmental Monitoring / Protection

The LGRL Waste Removal Plan specified environmental monitoring and protection methods that were required in association with waste excavation and relocation activities. The required environmental monitoring / environmental protection items included:

- Ambient Air Monitoring
- Dust and Odor Control
- Surface Water Management
- Waste Contact Water Management

Each of the above items is discussed in the sections below.

7.3.1 Ambient Air Monitoring

Section 4.5.1 of the LGRL Waste Removal Plan required that ambient air-monitoring be conducted both on and off site at upwind and downwind locations. Ambient air monitoring was to be conducted weekly for the first six weeks and if no contaminants were discovered, biweekly thereafter. The main constituents of concern were volatile organic compounds (VOCs). During the project a total of 50 ambient air samples were collected. Samples were collected using SilcoCans that were put under a vacuum in the lab. Each can was fitted with a regulator that allowed for continuous sample collection over an approximately 8-hour period. A total of four samples were required for each sampling event per the LGRL Waste Removal Plan: one upwind, one in the public drop off area, and

two downwind. An additional sample was added at the working face of the LGRL landfill to assess the VOC concentrations within the waste itself. This was done as a safety precaution for workers that were consistently present in or near the waste. There were instances where sampling containers were placed in the waste excavation equipment. Sample numbers GRL-PHBAIR-6, 8, 10, 11, 12, 13, 14, 15, were installed in excavation equipment. This was done to further check the contaminant levels in the equipment when PID readings indicated elevated VOC levels.

During sampling, weather conditions such as temperature, precipitation, barometric pressure, pressure trend, wind speed, and wind direction were recorded with each sampling event. Samples were not collected when sustained winds over 15 miles per hour (mph) were present.

Following collection, samples were shipped to Air Technologies Laboratories (ATL) in the City of Industry, California. ATL analyzed each of the samples for VOCs in accordance with EPA Method TO 15.

Appendix D of the report includes sample locations, summarizes sample detections, and includes the lab reports from the laboratory. Sample detections were compared to OSHA permissible exposure limits (PELs) as is shown in Appendix D. All of the constituents that were detected were well below the OSHA PELs. Due to the low concentrations of VOCs that were detected, it is difficult to state whether the VOCs that were detected were from the waste, vehicle exhaust, or to other activities on or off the site.

Samples were to be collected weekly for the first 6 weeks of the project. If clean results were obtained, sampling could be reduced to biweekly per the LGRL Waste Removal Plan. Sampled dates are summarized below:

Week 1: 2/6/15
Week 2: Missed
Week 3: 2/17/15, 2/19/15
Week 4: 2/26/15
Week 5: 3/5/15
Week 6: 3/11/15
Week 8: 3/26/15
Week11: 4/14/15
Week 13: 4/29/15
Week 15: 5/14/15

Based on the results obtained from the air monitoring sample analyses, no apparent threat to the environment or human health due airborne VOCs was noted during the project.

7.3.2 Dust and Odor Control Measures

Throughout the excavation process dust was controlled by watering haul roads and, when necessary, the waste excavation area. Watering of roads was completed on an as needed basis to control dust. During days when dust control was required, roads were watered several times per day to mitigate dust on site haul roads.

At the beginning of the excavation process, it was unknown how strong odors would be. As a preventative measure, Advanced employed the use of odor control devices that utilize odor neutralizing agents mixed with water. A portable trailer mounted system consisting of a trailer mounted 1,000 gallon water tank, spray bars, and pump was utilized. Water and odor neutralizing agent were pumped from the tank to the spray bars where a fine mist was produced. The trailer mounted system could easily be moved to areas that had higher odor concentrations.

Odors were not considered excessive during the project and rarely migrated off site. The odor system was run continuously during non-freezing weather while waste was being relocated.

7.3.3 Surface Water Management

During waste excavation the clean runoff water was prevented from entering the excavation area. The main method used to prevent clean runoff from entering the excavation was grading around the excavation to divert surface water away from the working face. Surface water that did contact waste was managed as leachate as is detailed in Section 7.3.4.

7.3.4 Contact Water / Leachate Management

Water that contacted waste or contaminated soils was treated as leachate. To prevent the migration of contact water off site, the excavation was graded to a low point where contact water could drain. The low point consisted of a collection sump and pump station that was used to transfer the contact water to leachate trucks. All contact water was treated as leachate and taken off site for disposal at a wastewater treatment plants (WWTP). During the project the total volume of leachate taken off site from the excavation was approximately 78,000 gallons.

7.3.5 Groundwater Dewatering

During the excavation of the waste and the construction of the east perimeter berm, groundwater dewatering was required. Groundwater that did not contact waste was pumped to the underdrain system and treated with the air stripper. Sampling of the

groundwater was conducted in accordance with the site's WPDES permit. ESC, Inc. reported the results on a monthly basis as required by the WPDES permit.

7.4 Waste Handling, Screening and Characterization

Waste handling, screening and characterization procedures are specified in Section 4 of the LGRL Waste Removal Plan. The LGRL Waste Removal Plan identified four major waste categories as listed below:

- Typical waste (municipal and industrial)
- Salvageable waste
- Suspicious waste
- Hazardous waste

During the excavation process, the CQM Field Technician screened and characterized the waste removed through visual observations, odor observations and performed periodic readings with a Photo Ionization Detector (PID) to identify suspicious and potentially hazardous wastes. The waste screening process and subsequent handling process is described in the sections below.

7.4.1 Typical Waste

Waste was classified as typical waste if it exhibited the following characteristics:

- The waste resembled MSW or waste typically disposed of in GRL
- The waste did not exhibit solvent odor
- The waste did not exhibit positive PID readings

The majority of the waste exhumed from LGRL was classified as typical waste.

Mashuda Contractors, Inc. used two CAT 374 Excavators to load between eight and ten articulated 40 ton haul trucks daily. The excavators loaded the LGRL waste into the haul trucks, and the haul trucks transported the waste to the active GRL. Typical waste was dumped in the active area and was spread utilizing CAT D8 dozers and the landfill's compactors. LGRL waste was either commingled with incoming waste or was mono-filled. At times it was difficult to commingle excavated LGRL waste with incoming MSW due to safety and traffic pattern concerns. Waste within GRL was covered on a daily basis with alternate daily cover (ADC) or soil materials. Waste that was placed on outboard slopes was covered with one foot of intermediate cover soil after placement. The minimum separation distance between the leachate drainage layer and the LGRL waste was 15 feet.

7.4.2 Salvageable Waste

Salvageable waste was not identified during the waste screening and characterization. As such no waste was salvaged as part of the Phase B Waste Removal.

7.4.3 Suspicious Waste

Suspicious wastes were identified through visual and odor observations, and by screening the waste with a photoionization detector (PID). All workers and equipment operators that were continually in the waste excavation area wore personal gas detection meters that had PID capability. The meters were utilized for worker health and safety primarily, but were also utilized to detect potentially VOC contaminated waste. The LGRL Waste Removal Plan did not specify a VOC concentration determined in the field that would in turn characterize the waste as suspicious. Discussions were conducted with the WDNR during the Phase A project regarding the lack of a VOC concentration specifications for treating waste in the field. Through the discussions with the WDNR, if a VOC reading of the 10 ppm was detected with the PID, the waste would be characterized as suspicious and further testing would be required. The basis for the 10 ppm limit is from the LGRL Waste Removal Plan Soil Management Section. Section 6.2.2 of the LGRL Waste Removal Plan specified a VOC concentration of 10 ppm for soil found within the waste to determine the use for the soil. Since this was used for the soil within the waste, it was determined that this standard could also apply to suspicious waste. Equipment operators and the CQM Field Technician also visually observed the excavation for the presence of intact drums, transformers, and other containers that may have housed suspicious waste. No intact drums, containers, or transformers were found during the excavation.

Suspicious waste was identified on a relatively routine basis. CQM monitored the waste on a 30 minute basis to aid in identifying bulk suspicious waste. In general levels read by the PID were below 50 ppm. Prior to initiating lab testing, the waste was transported and placed in the active GRL site. The waste was allowed to "air out" over the course of the work day and PID readings were taken at the end of the day. If the PID readings fell below 10 ppm, the waste was considered typical and incorporated into the active GRL. All bulk suspicious loads of waste dropped below 10 ppm after relocation and as such no laboratory testing was conducted. The total volume of suspicious waste removed from the Phase B was approximately 20,472 cubic yards.

7.4.4 Hazardous Waste

No hazardous waste was identified through the screening procedures described in the LGRL waste removal plan.

7.5 Waste Types and Quantities

As noted above the majority of waste that was excavated in the Phase B area was disposed of in the GRL as typical waste. Some bulk suspicious waste was identified during the waste screening and characterization. All bulk suspicious wastes were tested in the field for total VOCs and met the minimum disposal requirements for disposal in GRL after relocation. No hazardous wastes were identified. The total volume of waste removed is as follows:

- Typical Waste = 413,758 cubic yards (CY)
- Bulk Suspicious Waste = 20,472 cubic yards (CY)

8 SOIL EXCAVATION

8.1 Introduction

Soil excavation followed the Soil Management Plan included in Section 6 of the LGRL Waste Removal Plan. Soils that were excavated generally consisted of cover soils, soils within the waste, berms, and native soil underlying the waste. Soil was classified in accordance with the LGRL Waste Removal Plan and used for beneficial reuse, disposed of or treated. The following sections detail the soil excavation from the site.

8.2 Soil Types

The LGRL Waste Removal Plan identified four different types of soils. Soils removed from LGRL were classified into one of the four types described below based on contamination levels. The LGRL Waste Removal Plan identified how each type of soil was to be managed. The soil types identified in the LGRL Waste Removal Plan are as follows (see the LGRL Waste Removal Plan for more detailed descriptions):

- Type 1 – Soil that is not impacted above soil standards. Type 1 soil could be used anywhere on the site. To confirm soil could be classified as Type 1, it was tested in the lab for Lead, Cadmium, and VOCs. PCB Testing was not completed as the soils did not contain potentially PCB laden equipment or materials. If soil was not impacted above the soil residual contaminant level established under NR 720, the soil could be utilized on site without restrictions.
- Type 2 – Soil that was impacted and may contain contaminants above the NR 720 RCLs but below the TCLP limits. Type 2 soil could be used within the lined area of the landfill as daily cover. Type 2 soils did not require laboratory testing to be used in the footprint or disposed of as waste unless they were identified as suspicious wastes.
- Type 3 – Soil that is impacted and may contain contaminants above the NR 720 RCLs for direct contact but are below the groundwater standards. Type 3 soils were not identified during the project.
- Type 4 – Soil that exceeds the TCLP limits and must be treated prior to disposal. Type 4 soils were not identified during the project.

8.3 Soil Sampling, Analysis and Classification

Several different soils were encountered during the excavation of the LGRL waste and included cover soils, soil within the waste, soil between the bottom of waste and Phase 7 Subbase, and additional soils excavated for remediation. Each of the soils excavated are described in detail in the following sections:

8.3.1 LGRL Final Cover Soils

As was discussed in Section 6.2.1 of the LGRL Waste Removal Plan, final cover soils could be classified as Type 1 soils unless they were observed to be in direct contact with waste or exhibited other characteristics such as staining or odor. Soils that were within 6 inches of the waste were treated as waste and disposed of. Detailed cover soil excavation and stockpiling is discussed in Section 4 of this report.

8.3.2 Soil Within the LGRL Waste

Soil within the LGRL waste mass was treated entirely as waste. Based on the observations during the excavation it was not practical to separate soil from waste and as such the soil was not tested for reuse. Soil within the waste was only tested if it was part of a suspicious waste observation as detailed in Section 7 of this report.

8.3.3 Soil Between the Bottom of LGRL Waste and Above Phase 7 Liner Subbase Grades

The bottom of the LGRL waste was above the subbase grades for the Phase 7 composite liner. Soil in this region zone excavation to achieve the subbase grades and was required to be tested if used outside of the GRL footprint. During waste excavation, soil that was visually stained by the waste was treated as waste and disposed of in the GRL active area. The depth of soil that was removed and disposed of was generally between 1 and 2 feet below the bottom of the waste.

The soil that remained was tested to determine where the soil could be utilized. Testing consisted of dividing the site into approximately 0.5 acre subareas where test pits were dug to test the underlying soils. Samples were collected at each of the test pit locations on minimum 5 foot intervals and analyzed for VOCs, Cadmium and Lead. Figure 1 in Appendix E shows the location of the test pits.

The soil test results were compared to NR 720 RCLs for groundwater and direct contact, TCLP limits. A summary of the data is presented in Appendix E. There were several exceedances for various contaminants as shown in the summary of the data. Soil that did not meet the limits for use outside of the GRL footprint was disposed of or used as daily cover within the limits of waste. A total of 89,014 cubic yards of contaminated soil was disposed of in the active GRL. Figures 1-10 in Appendix F show the location within the active GRL where contaminated soil was disposed.

8.3.4 Additional Soil Excavation for Remediation

As part of the LGRL Waste Relocation plan, a soil remediation plan was put into place that required removal of soils from below the Southeast Expansion subbase grades. A total of 3,000 cubic yards of soil could be removed for remediation across the entire LGRL area.

After all of the LGRL waste had been removed from the Phase B area, the subbase was inspected for areas that had high levels of VOC contamination. There were three areas that were found within the LGRL waste that contained VOC levels that warranted additional investigation. The areas were centered around Soil Sample locations SS-2, SS-5, and SS-7 as indicated in Figure 2 in Appendix G. Preliminary test pits were dug to determine the level of contamination. A PID was used to estimate VOC concentrations, PID readings indicated VOC contamination levels above 100 ppm.

The WDNR was informed of the areas of VOC contamination. Advanced Disposal and the WDNR collaborated to determine a course of action for removing the soil. The bullet points below describe the methods used to bound the area and remove the contaminated soil.

- First, additional test pits were dug surrounding the center of the VOC contamination under the direction of the WDNR. Figure 2 shows a simple diagram as to how the test pit locations were determined. Several additional test pits were dug and soils were analyzed with the PID. The center of the VOC contamination areas were used as the starting point and test pits were dug moving out from the center. The boundary of the VOC contaminated soil was determined based on field PID readings. When field PID readings dipped below 10 ppm, the bounds of the contaminated soil were assumed to be detected.
- Figure 2 shows the area of soil that was removed below the subbase grades. The total volume of soil removed was approximately 800 cubic yards. Additional soil samples were taken after soil was removed to assess the level of contamination remaining. The combined additional soil excavation for remediation between Phase A and B is 1370 cubic yards.
- The impacted soil was relocated to the active GRL. Lab results indicated that none of the soil removed was above the maximum disposal limits.

9 CONCLUSION

The LGRL Phase B Waste Relocation project has been completed in accordance with the approved Plan of Operation, the construction plans and specifications, Chapters NR 500, 660 and 700 Wis. Adm. Code. On behalf of Advanced Disposal, Cornerstone respectfully requests the review and approval of this Construction Documentation Report.

1 INTRODUCTION

1.1 General Information

This Construction Documentation Report documents the Land and Gas Reclamation Landfill (LGRL) Phase C Waste Relocation Project. LGRL is a Superfund site, Wisconsin Department of Natural Resources (WDNR) License No. 1118, Environmental Protection Agency (EPA) ID No. WID0529060888 that is located within the approved Advanced Disposal Services (Advanced) Glacier Ridge Landfill (GRL) Southeast Expansion footprint. LGRL is located in the SW ¼ of Section 35 T12N, R16E, Town of Williamstown, Dodge County, Wisconsin.

LGRL is part of the larger Advanced GRL facility which is comprised of LGRL, the Closed North Landfill, the South Expansion and the Southeast Expansion. With the exception of LGRL all of the other landfill areas accept or accepted only non-hazardous waste in accordance with Chapter NR 500 Wisconsin Administrative Code. The facility is owned and operated by Advanced Disposal Services Glacier Ridge Landfill, LLC.

1.2 Site History

LGRL is a Superfund site that began accepting waste in the 1950s and was closed in the mid-1980s. A combination of municipal solid waste, construction debris, and solvent waste were accepted at LGRL over its life. LGRL is located in the footprint of the proposed GRL Southeast Expansion. As part of the Plan of Operation for the GRL Southeast Expansion, prepared by SCS Engineers, Madison, WI (date of WDNR approval October 2013), LGRL would be removed in three phases to remediate the site and to allow for the construction of the Southeast Expansion. Phase C, the final phase of the waste relocation, was completed in March 2016.

A plan for relocating the LGRL waste (LGRL Waste Removal Plan, Dec. 2013) was prepared as part of the Plan of Operation for the Southeast Expansion and approved by the WDNR. The LGRL Waste Removal Plan was used as the basis for the relocation of the LGRL waste.

1.3 Purpose and Scope

Cornerstone was retained by Advanced to provide oversight during Phase C of the LGRL Waste Relocation Project to ensure completion of the project in accordance with the GRL Southeast Expansion Plan of Operation, the LGRL Waste Removal Plan, and the GRL Southeast Expansion Plan of Operation WDNR Conditions of Approval.

2 CONSTRUCTION DOCUMENTS AND PARTIES

2.1 Reference Documents

The following reference documents were utilized during the execution of the LGRL Phase C Waste Relocation:

- Chapter NR 500 Wisconsin Administrative Code
- Chapter NR 600 Wisconsin Administrative Code
- Chapter NR 140 Wisconsin Administrative Code
- USEPA SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods"
- Southeast Expansion Conditional Plan of Operation Approval and Hazardous Waste Remediation Variance dated October 13, 2014
- Document Titled: "Land & Gas Reclamation Landfill Waste Removal Plan for Glacier Ridge Landfill Southeast Expansion" (Revision 1) prepared by SCS Engineers, Madison, WI dated December 2013.
- Document Titled: "Plan of Operation – Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated April 23, 2013.
- Document Titled: "Plan of Operation Addendum No. 1 - Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated June 28, 2013.
- Document Titled: "Plan of Operation Addendum No. 2 - Advanced Disposal Services Glacier Ridge Landfill Southeast Expansion" prepared by SCS Engineers, Madison, WI dated October 3, 2013.

2.2 Parties

The following parties were involved in the LGRL Phase C Waste Relocation:

<u>Wisconsin Department of Natural Resources (WDNR)</u>

Ann Bekta, P.E. – Waste Management Engineer

Adam Hogan, P.G. – Hydrogeologist

Will (Woody) Myers – Hydrogeologist

Advanced Disposal Glacier Ridge Landfill, LLC

Jay Warzinski – Corporate Director of Landfill Operations

Tim Curry – Regional Landfill Operations Manager

Lonn Walter – General Manager

Jake Margelofsky – Operations Manager

Cornerstone Environmental Group, LLC (Project Management)

Tyler Field – Project Manager

Mark Torresani, P.E. – Certifying Engineer

CQM, Incorporated (Survey, CQA, Physical Soil Analysis)

Nick Sturzl, P.E. – Project Manager

Rick Wiemann – Project Technician

Austin Field – Projecct Technician

Tom Bishop – Project Technician

SCS Engineers, Inc. (Design Engineer)

Sherren Clark, P.E., P.G. – Hydrogeology

Hoffman Construction Company (General Contractor)

Chad Sell –Project Manager

Jay Kahl – Project Superintendent

PACE Analytical (Soil/Waste/Liquid Analytical Laboratory)

Dan Milewsky – Project Manager

Air Technology Laboratories, Inc. (Air Sample Analytical Laboratory)

Joann De La Ossa – Project Manager

3 EROSION CONTROL AND WETLAND PROTECTION

Prior to construction startup, erosion control measures were installed to protect the wetland areas to the north and east of the LGRL Phase C Excavation Area. The wetland protection included the protection provisions specified in the Wetland Protection and Erosion Control Plan. The Wetland Protection and Erosion Control Plan was included in Appendix E of the Southeast Expansion Plan of Operation. At the beginning of the project steel backed silt fence with a warning ribbon was installed prior to any construction commencing. The silt fence was installed along the approved line as specified in the Plan of Operation and as shown in the attached plan set. After storm events occurred and on a minimum weekly basis, the project technician inspected the silt fence and recorded the results on wetland inspection forms. The wetland inspection forms are included in Appendix A.

No work occurred in the wetland outside of the predetermined boundaries specified in the Wetland Protection and Erosion Control Plan. In addition, during construction all non-contact surface water runoff was directed to Sedimentation Basin No.2 located to the north of the LGRL Phase C Excavation Area. All precipitation and storm water runoff that came into contact with waste or contaminated soils was contained in the area of excavation, collected and routed or hauled to the leachate collection system for subsequent treatment. No contact water was allowed to run off of the excavation area, and enter the wetlands or landfill storm water management systems.

4 COVER SOIL EXCAVATION

Prior to performing waste excavation activities, the cover soils on top of the waste removed. The cap consisted of the following layers from top to bottom:

- Vegetative layer
- 6-inch minimum topsoil layer
- Rooting zone layer (variable depth, 24 inches min.)
- 24-inch thick clay cap layer
- Grading Layer (variable depth, min. 6 inches)

A large portion of the topsoil and rooting zone layers in Phase C were excavated during 2015. These soils were utilized to construct portions of the perimeter berm for the Phase 7 Liner Project. Clay cap soils were kept intact until just prior to the excavation of the Phase C Waste.

Efforts were made to segregate soils during the remainder of the excavation. Topsoil was stockpiled in south stockpile area for future projects, rooting zone was stockpiled or used for daily cover. Clay was segregated, then used as intermediate cover on the south slope of Phase 3 and stockpiled for future use to the north of the LGRL facility. Soils that were within 6 inches of the waste or that were too frozen to separate from the underlying waste were not segregated and were treated as waste in accordance with the LGRL Waste Removal Plan, and were tested and hauled to active area of landfill for disposal.

5 LANDFILL GAS SYSTEM ABANDONMENT

5.1 LFG Well and Piping Abandonment

LGRL contained an active gas extraction system. During the Phase A waste relocation project, eight (8) vertical landfill gas (LFG) extraction wells were abandoned and the blower/flare station was relocated. During the Phase B waste relocation project, four (4) vertical wells and all associated lateral and header piping was abandoned. Following the Phase B construction, a total of two (2) vertical LFG extraction wells were still in place and operational. Each well was connected to the blower flare station located near the center of the Phase C LGRL area. Prior to the Phase C waste relocation the two (2) remaining vertical wells were abandoned by the site, along with all associated lateral and header piping. The two (2) wells were GWL1 and GWL10. Wells and piping were removed as the waste was excavated. All well and lateral components were disposed of in the active GRL.

5.2 Blower / Flare System Removal

The blower/flare system was originally located at the northwest corner of LGRL which was in the excavation area. As part of Phase A, the blower/flare system was relocated to south end of LGRL in Phase C as shown on Drawing No. 5. The blower/flare system was then abandoned and removed from this location just prior to Phase C waste relocation.

5.3 LFG Condensate Management

One temporary condensate management sump CS-1 was abandoned and removed prior to Phase C waste relocation. This was the last condensate management feature in the LGRL area.

All remaining components of the previously existing LGRL active gas extraction system were removed prior to, or during Phase C construction. Material was disposed of in the active GRL.

6 MONITORING WELL ABANDONMENT

6.1 Non-Groundwater Well Abandonments

No non-groundwater wells were abandoned as part of the Phase C Waste Relocation project.

6.2 Groundwater Well Abandonments

One groundwater monitoring well required abandonment as part of the Phase C Waste Relocation project to allow for the construction of the subsequent Phase 8 Composite Liner. The groundwater monitoring well abandoned was outside of the LGRL waste limits:

- MW407 (WI Unique Well # VW503)

This well was over drilled, the casing and screen was removed, and the borehole backfilled in accordance with Chapter NR 141 Wis. Adm. Code. The Well Abandonment Form is included in Appendix C.

7 WASTE EXCAVATION

7.1 Introduction

Excavation of LGRL Waste began on January 4, 2016 and was completed by March 21, 2016. This section details the site health and safety, environmental monitoring and protection, waste handling, screening and characterization methods, quantities and types of waste removed, details of waste handling and screening procedures, and details of suspicious waste removal and handling. Photos of the waste excavation and associated activities are presented in Appendix B.

7.2 Environmental Monitoring / Protection

The LGRL Waste Removal Plan specified environmental monitoring and protection methods that were required in association with waste excavation and relocation activities. The required environmental monitoring / environmental protection items included:

- Ambient Air Monitoring
- Dust and Odor Control
- Surface Water Management
- Waste Contact Water Management

Each of the above items is discussed in the sections below.

7.2.1 Ambient Air Monitoring

Section 4.5.1 of the LGRL Waste Removal Plan required that ambient air-monitoring be conducted both on and off site at upwind and downwind locations. Ambient air monitoring was to be conducted weekly for the first six weeks and if no contaminants were discovered, biweekly thereafter. The main constituents of concern were volatile organic compounds (VOCs). During the project a total of 40 ambient air samples were collected. Samples were collected using SilcoCans that were put under a vacuum in the lab. Each can was fitted with a regulator that allowed for continuous sample collection over an approximately 8-hour period. A total of four samples were required for each sampling event per the LGRL Waste Removal Plan: one upwind, one in the public drop off area, and two downwind. An additional sample was added at the working face of the LGRL landfill to assess the VOC concentrations within the waste itself. This was done as a safety precaution for workers that were consistently present in or near the waste. There were no instances where sampling containers were placed in the waste excavation equipment, because PID readings inside the equipment never indicated elevated VOC levels during excavation operations.

During sampling, weather conditions such as temperature, precipitation, barometric pressure, pressure trend, wind speed, and wind direction were recorded with each sampling event. Samples were not collected when sustained winds over 15 miles per hour (mph) were present.

Following collection, samples were shipped to Air Technologies Laboratories (ATL) in the City of Industry, California. ATL analyzed each of the samples for VOCs in accordance with EPA Method TO 15.

Appendix D of the report summarizes sample detections from air monitoring taking place during the project. Sample detections were compared to OSHA permissible exposure limits (PELs) as is shown in Appendix D. All of the constituents that were detected were well below the OSHA PELs. Due to the low concentrations of VOCs that were detected, it is difficult to state whether the VOCs that were detected were from the waste, vehicle exhaust, or to other activities on or off the site.

Samples were to be collected weekly for the first 6 weeks of the project. If clean results were obtained, sampling could be reduced to biweekly per the LGRL Waste Removal Plan. Sampled dates are summarized below:

Week 1: 01/07/2016
Week 2: 01/14/2016
Week 3: 01/20/2016
Week 4: 01/27/2016
Week 5: 02/04/2016
Week 6: 02/11/2016
Week 8: 02/23/2016
Week 10: 03/10/2016

No additional air samples were completed after March 10, 2016 due to the small amount of waste that remained and the fact that previous sample results had VOC concentrations well below the OHSA permitted levels.

Based on the results obtained from the air monitoring sample analyses, no apparent threat to the environment or human health due to airborne VOCs was noted during the project.

7.2.2 Dust and Odor Control Measures

Throughout the excavation process dust was controlled by watering haul roads, and if necessary, the waste excavation area. Watering of roads was completed on an as needed basis to control dust. During days when dust control was required, roads were watered several times per day to mitigate dust on site haul roads.

As a preventative measure, Advanced employed the use of odor control devices that utilize odor neutralizing agents mixed with water. A portable trailer mounted system consisting of a trailer mounted 1,000 gallon water tank, spray bars, and pump was utilized. Water and odor neutralizing agent were pumped from the tank to the spray bars where a fine mist was produced. The trailer mounted system could more easily be moved to areas that had higher odor concentrations.

Odors were not excessive during the project and did not migrate off site. The odor systems were run continuously during non-freezing weather while waste was being relocated.

7.2.3 Surface Water Management

During waste excavation any clean storm water runoff was prevented from entering the excavation area. The main method used to prevent clean runoff from entering the excavation was grading around the excavation to divert surface water away from the working excavation. Surface water that did contact waste was managed as leachate.

7.2.4 Contact Water / Leachate Management

Water that contacted waste or contaminated soils was treated as leachate. To prevent the migration of contact water off site, the working face excavation was continually kept graded to a low point where contact water could be contained. The low point consisted of a collection sump and pump station that was used to transfer the contact water to leachate trucks. All contact water was treated as leachate and taken off site for disposal at a wastewater treatment plants (WWTP).

7.2.5 Groundwater Dewatering

During the excavation of the waste and the construction of the Phase 8 east perimeter berm breaker run, groundwater dewatering was required. Groundwater that did not contact waste was pumped to the underdrain system and treated with the existing air stripper. Sampling of the groundwater was conducted in accordance with the site's WPDES permit. ESC, Inc. reported the results on a monthly basis as required by the WPDES permit. Groundwater testing results are included in Appendix F.

7.3 Waste Handling, Screening and Characterization

Waste handling, screening and characterization procedures are specified in Section 4 of the LGRL Waste Removal Plan. The LGRL Waste Removal Plan identified four major waste categories as listed below:

- Typical waste (municipal and industrial)
- Salvageable waste

- Suspicious waste
- Hazardous waste

During the excavation process, CQM's Technician screened and characterized the waste removed from Phase C through visual observations, odor observations and performed periodic readings with a Photo Ionization Detector (PID) to identify suspicious and potentially hazardous wastes. The waste screening process and subsequent handling process is described in the sections below.

7.3.1 Typical Waste

Waste was classified as typical waste if it exhibited the following characteristics:

- The waste resembled MSW or waste typically disposed of in GRL
- The waste did not exhibit solvent odor
- The waste did not exhibit PID readings above 10 ppm

The majority of the waste exhumed from LGRL was classified as typical waste.

Typical waste was handled by Hoffman Construction Company (Hoffman) using two CAT 385 Excavators to load between six and eight articulated 40 ton haul trucks daily. The excavators loaded the typical LGRL waste into the haul trucks, and the haul trucks transported the waste to the active GRL. Typical waste was dumped in the active area and spread utilizing CAT D8 dozers and the landfill's compactors. LGRL typical waste was either commingled with incoming waste or was mono-filled. At times it was difficult to commingle excavated LGRL waste with incoming MSW due to safety and traffic pattern concerns. Waste within GRL was covered on a daily basis with alternate daily cover (ADC) or clean soil materials. Waste that was placed on outboard slopes was covered with one foot of intermediate cover soil after placement. The minimum separation distance between the leachate drainage layer and the LGRL waste was 15 feet.

7.3.2 Salvageable Waste

Salvageable waste was not identified during the waste screening and characterization. As such no waste was salvaged as part of the Phase C Waste Removal.

7.3.3 Suspicious Waste

Suspicious wastes were identified through visual and odor observations, and by screening the waste with a PID. All workers and equipment operators that were continually in the waste excavation area wore personal gas detection meters that had PID capability. The meters were utilized for worker health and safety primarily, but were also utilized to detect potentially VOC contaminated waste. The LGRL Waste Removal Plan did not specify a VOC concentration determined in the field that would in turn characterize the waste as

suspicious. Discussions were conducted with the WDNR regarding the lack of a VOC concentration specifications for treating waste in the field. Through the discussions with the WDNR, if a VOC reading of 10 ppm or greater was detected with the PID, the waste would be characterized as suspicious and further testing would be required. The basis for the 10 ppm limit is from the LGRL Waste Removal Plan Soil Management Section. Section 6.2.2 of the LGRL Waste Removal Plan specified a VOC concentration of 10 ppm for soil found within the waste to determine the use for the soil. Since this was used for the soil within the waste, it was determined that this standard could also apply to suspicious waste. Equipment operators and the CQM Field Technician also visually observed the excavation for the presence of intact drums, transformers, and other containers that may have housed waste meeting the definition of non-bulk suspicious.

Suspicious waste was identified on a relatively routine basis. CQM monitored the waste on a 30 minute basis to aid in identifying bulk suspicious waste. In general, levels read by the PID were below 50 ppm. Prior to initiating lab testing, the waste was transported and staged in the active GRL site. The waste was allowed to "air out" over the course of the work day and PID readings were taken at the end of the day. If the PID readings fell below 10 ppm, the waste was considered typical and incorporated into the active GRL. All bulk suspicious loads of waste dropped below 10 ppm after relocation and as such no laboratory testing was conducted. The total volume of suspicious waste removed from the Phase C was approximately 8,410 cubic yards.

7.3.4 Hazardous Waste

No hazardous waste was identified through the screening procedures described in the LGRL waste removal plan.

7.4 Waste Types and Quantities

As noted above the majority of waste that was excavated in the Phase C area was disposed of in the GRL as typical waste. Bulk and non-bulk suspicious waste was identified during the waste screening and characterization. All bulk and non-bulk suspicious wastes were tested in the laboratory for total VOCs and met the minimum disposal requirements for disposal in GRL. No hazardous wastes were identified. The total volume of waste removed is as follows:

Phase C

- Typical Waste = 301,252 cubic yards (CY)
- Bulk Suspicious Waste = 8,410 cubic yards (CY)
- Non-Bulk Suspicious Waste = 3 intact cylinder tanks

Total LGRL (Phases A, B, C)

- Typical Waste = 1,299,404 CY
- Bulk Suspicious Waste = 29,002 CY

8 SOIL EXCAVATION

8.1 Introduction

Soil excavation followed the Soil Management Plan included as in Section 6 of the LGRL Waste Removal Plan. Soils that were excavated generally consisted of cover soils, soils within the waste, berms, and native soil underlying the waste. Soil was classified in accordance with the LGRL Waste Removal Plan and used for beneficial reuse, disposed of or treated. The following sections detail the soil excavation from the site.

8.2 Soil Types

The LGRL Waste Removal Plan identified four different types of soils. Soils removed from LGRL were classified into one of the four types described below based on contamination levels. The LGRL Waste Removal Plan identified how each type of soil was to be managed. The soil types identified in the LGRL Waste Removal Plan are as follows (see the LGRL Waste Removal Plan for more detailed descriptions):

- Type 1 – Soil that is not impacted above soil standards. Type 1 soil could be used anywhere on the site. To confirm soil could be classified as Type 1, it was tested in the lab for Lead, Cadmium, and VOCs. PCB Testing was not completed as the soils did not contain potentially PCB laden equipment or materials. If soil was not impacted above the soil residual contaminant level established under NR 720, the soil could be utilized on site without restrictions.
- Type 2 – Soil that was impacted and may contain contaminants above the NR 720 RCLs but below the allowable TCLP limits. Type 2 soil could be used within the lined area of the landfill as daily cover. Type 2 soils did not require laboratory testing to be used in the footprint or disposed of as waste unless they were identified as suspicious wastes.
- Type 3 – Soil that is impacted and may contain contaminants above the NR 720 RCLs for direct contact but are below the groundwater standards.
- Type 4 – Soil that was identified as suspicious, was tested, exceeded the TCLP limits, and must be treated prior to disposal.

8.3 Soil Sampling, Analysis and Classification

Several different soils were encountered during the excavation of the LGRL waste and included cover soils, soil within the waste, soil between the bottom of waste and Phase 8 Subbase, and additional soils excavated for remediation. Each of the soils excavated are described in detail in the following sections:

8.3.1 LGRL Final Cover Soils

As was discussed in Section 6.2.1 of the LGRL Waste Removal Plan, final cover soils could be classified as Type 1 soils unless they were observed to be in direct contact with waste or exhibited other characteristics such as staining or odor. Soils that were within 6 inches of the waste were treated as waste and disposed of. Detailed cover soil excavation and stockpiling is discussed in Section 4 of this report.

8.3.2 Soil Within the LGRL Waste Mass

Soil within the LGRL waste mass was treated entirely as waste. Based on the observations during the excavation it was not practical to separate any soil from waste and as such the soil was not tested for reuse. Soil within the waste was only tested if it was part of a suspicious waste observation as detailed in Section 7 of this report.

8.3.3 Soil Between the Bottom of LGRL Waste and Above Phase 8 Liner Subbase Grades

The base of the LGRL waste mass was above the subbase grades for the Phase 8 composite liner. Soil in this zone required excavation to achieve the subbase grades and was required to be tested if used outside of the GRL footprint. Soil removal depths in this region ranged from 0 to 18 feet with an average depth of approximately 10 feet. During waste excavation, soil that was visually stained was treated as waste and disposed of in the GRL active area.

Testing of the remaining soil above the Phase 8 subbase grades consisted of dividing the site into approximately 0.5 acre subareas where test pits were dug to test the underlying soils. Samples were collected at each of the test pit locations on maximum 5 foot intervals and analyzed for VOCs, Cadmium and Lead. Figure 1 shows the location of the test pits.

The soil test results were compared to NR 720 RCLs for groundwater and direct contact, TCLP limits. A summary of the data is presented in Appendix E. There were several exceedances for various contaminants as shown in the summary of the data. Soil that did not meet the limits for use outside of the GRL footprint was disposed of or used as daily cover within the limits of waste. Contaminated soil was disposed of in Phases 6 and 7 of the active GRL.

8.3.4 Additional Soil Excavation for Remediation

As part of the LGRL Waste Relocation plan, a soil remediation plan was put into place that required removal of some of the soils from below the Southeast Expansion subbase grades. As part of the Waste Relocation Plan, up to a total of 3,000 cubic yards of soil could be removed for remediation at the request of the WDNR across the entire LGRL area.

After all of the LGRL waste had been removed from the Phase C area, the subbase was inspected with a WDNR representative (Woody Myers) for areas that had high levels of VOC contamination.

The WDNR was informed of the area of VOC contamination. Advanced Disposal and the WDNR collaborated to determine a course of action for removing the soil. The bullet points below describe the methods used to bound the area and remove the contaminated soil.

- First, additional test pits were dug surrounding the center of the VOC contamination under the direction of the WDNR. Figure 1 indicates the test pit locations. Several additional test pits were dug and soils were analyzed with the PID. The center of the VOC contamination areas were used as the starting point and test pits were dug moving out form the center. The boundary of the VOC contaminated soil was determined based on field PID readings. When field PID readings fell below 10ppm, the bounds of the contaminated soil were assumed to be detected.
- Figure 2 shows the area of soil that was removed below the subbase grades. The total volume of soil removed from area C below Phase 8 subbase grades was approximately 2,856 cubic yards. Additional soil samples were taken after soil was removed to assess the level of contamination remaining. The combined additional soil excavation for remediation between Phases A, B, and C is 4,226 cubic yards.
- The impacted soil was relocated to the active GRL. Lab results indicated that none of the soil removed was above the maximum disposal limits.

9 CONCLUSION

The LGRL Phase C Waste Relocation project has been completed in accordance with the approved LGRL Waste Relocation Plan, the construction plans and specifications, Chapters NR 140, 500, 600 and 700 Wis. Adm. Code. On behalf of Advanced Disposal, Cornerstone respectfully requests the review and approval of this Construction Documentation Report.

RE: Project: GLACIER RIDGE
Pace Project No.: 40129145

Dear Tyler Field:
Enclosed are the analytical results for sample(s) received by the laboratory on March 09, 2016. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Dan Milewsky

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, Inc.
1241 Bellevue Street - Suite 9
Green Bay, WI 54302
(920)469-2436

QUALIFIERS

Project: GLACIER RIDGE
Pace Project No.: 40129145

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor and percent moisture.

LOQ - Limit of Quantitation adjusted for dilution factor and percent moisture.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-G	Pace Analytical Services - Green Bay
PASI-M	Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
R1	RPD value was outside control limits.
W	Non-detect results are reported on a wet weight basis.

Pace Analytical Services, Inc.
1241 Bellevue Street - Suite 9

VOC Mass Removal Calculations

Land and Gas Reclamation Landfill
Volatile Organic Compound (VOC) Mass Removal Calculations

Waste Removal - Typical Waste

Phase	Typical Waste Volume (cubic yards)	Waste Density (lb/cy)	Waste Mass (tons)	Estimated Average VOC Concentration (mg/kg)	VOC Mass (lb)
A	584,394	1,200	350,636	38	26,648
B	413,758	1,200	248,255	38	18,867
C	301,252	1,200	180,751	38	13,737
Total	1,299,404		779,642		59,253

Notes:
1. Waste volumes from waste removal documentation reports.
2. Estimated average VOC concentration is t he median total VOC concentration from the waste characterization boring samples collected in 2006.
3. Dry density of waste is 1,200 pounds per cubic yard

Waste Removal - Suspicious Waste

Phase	Suspicious Waste Volume (cubic yards)	Waste Density (lb/cy)	Waste Mass (tons)	Estimated Average VOC Concentration (mg/kg)	VOC Mass (lb)
A	120	1,200	72	14	2
B	20,472	1,200	12,283	38	934
C	8,410	1,200	5,046	38	383
Total	29,002		17,401		1,319

Notes:
1. Waste volumes from waste removal documentation reports.
2. For Phase A, estimated average VOC concentration is the average of samples collected from the Phase A suspicious waste.
3. Suspicious waste from Phases B and C was not separately sampled (field screened only); therefore, estimated average VOC concentration is the median total VOC concentration from the waste characterization boring samples collected in 2006.
4. Dry density of waste is 1,200 pounds per cubic yard

Land and Gas Reclamation Landfill
Volatile Organic Compound (VOC) Mass Removal Calculations

Soil Removal

Soil Excavation to Subbase

Phase	Contaminated Soil Excavation to Subbase (cubic yards)	Assumed Soil Density (lb/cy)	Soil Mass (tons)	Estimated Average VOC Concentration (mg/kg)	VOC Mass (lb)
A	8,497	3,100	13,170	18	474
B	89,014	3,100	137,972	10	2,759
C	44,000	3,100	68,200	141	19,232
Total	141,511		219,342		22,466

Notes:
1. Contaminated soil volumes for Phases A and B from waste removal documentation reports.
2. Contaminated soil volume for Phase C was not in the waste removal documentation report, so it was estimated from the total expected soil excavation volume from the 2013 Plan of Operation, Plan Sheet 10 (133,600 cubic yards), and the percent of Phase C samples that exceeded NR 702 standards (32%).
3. Estimated average VOC concentration for each phase is based on post-waste-removal samples collected from test pits excavated from the soil surface below the waste to the approximate subbase grades for the GRL liner.
4. Dry density of soil is 3,100 pounds per cubic yard (based on test results for till in GRL 2010 Feasibility Report)

Targeted DNR Over Excavation Below Subbase

Phase	DNR Over Excavation (cubic yards)	Assumed Soil Density (lb/cy)	Soil Mass (tons)	Estimated Average VOC Concentration (mg/kg)	VOC Mass (lb)
A	570	3,100	884	207	366
B	800	3,100	1,240	158	392
C	2,856	3,100	4,427	4	35
Total	4,226		6,550		793

Notes:
1. Contaminated soil volumes from waste removal documentation reports.
2. Estimated average VOC concentration for Phases A and B are based on samples collected from test pits and confirmation samples collected in the additional excavation area.
3. Estimated average VOC concentration for Phase C are based on confirmation samples collected in the additional excavation area.
4. Dry density of soil is 3,100 pounds per cubic yard (based on test results for till in GRL 2010 Feasibility Report)

Total Waste VOCs (lb), rounded	61,000
Total Soil VOCs (lb), rounded	23,000
Total Waste and Soil VOCs (lb)	84,000

I:\25221008.02\Deliverables\Changed Conditions Memo\E - VOC Calcs\[Mass removal calculation_v0.6.xlsx]Totals

Note: Individual VOC concentration data from laboratory report for SS-28 through SS-36, included in Attachment D. Samples from the original test pits at subbase elevations were not included in the average because it was not clear from the documentation report which subbase samples were in the additional targeted excavation area. Therefore, the actual average concentration for the targeted area is likely somewhat higher than the calculated average using only these samples from the base of the targeted excavation.

Totals 2016-2020		**82,640.927**		**24.8**
Totals Gallons 2016-2020		**82,640,927**		

Notes:

1. Total VOCs is the sum of detected VOC concentrations for underdrain sampling results obtained from the WDNR's Groundwater Environmental Monitoring Systems (GEMS) online database.
2. Monthly flows obtained from GEMS online database.
3. For calculations, the monthly VOC concentrations was assumed equal to the sample result for for sampling months and equal to the average of the preceding and following samples for months between sampling events.
4. Mass VOCs (lbs) = Flow (gallons) x 8.34 lb/gal x Concentration (ppb) / 1,000,000,000
