FIELD ACTIVITIES THIS REPORTING PERIOD

- Groundwater elevations were measured at 27 monitoring wells during the July and October 2009 sampling events. Water levels in Layer 4 wells were measured consecutively to avoid any effects from municipal pumping.
- Three private drinking wells were sampled for VOCs during the July 2009 event. The sampling program followed the plan approved by the WDNR in a letter dated July 26, 2007.
- A total of 23 monitoring wells and three private drinking wells were sampled for VOCs during the October 2009 event. Water samples from eighteen of these monitoring wells and three private drinking wells were analyzed for natural attenuation parameters that include iron II, methane, nitrate, nitrite sulfate and sulfite. Two duplicate samples were collected for quality control. The sampling program followed the plan approved by the WDNR in a letter dated October 21, 2009.
- Landfill gas monitoring in gas probes, monitoring wells and extraction points along with gas sampling at LC-1, LC-2, LC-3, GV-6 and GP-3 was conducted during the July and October 2009 sampling events. Each gas sample was submitted to the laboratory for VOC analyses.
- A pressure test was conducted on the interim landfill gas extraction system. The test was conducted on August 28, 2009 in accordance with Addendum #1: Engineering Design Plans and Specifications by GeoTrans, Inc. dated December 22, 2006.
- A landfill cap inspection was conducted on November 4, 2009.

RESULTS OF FIELD ACTIVITIES

Groundwater Monitoring Event - Groundwater Elevations

The groundwater monitoring wells located at the FF/NN Landfill are grouped into four layers based on well screen elevations to better evaluate groundwater quality at discrete depth intervals. Attachment A contains a table showing the wells for each of the four layers.

For the July 2009 sampling event, groundwater elevations were measured in all 27 monitoring wells by Jack Wendler from the City of Ripon. For the October 2009 sampling event, groundwater elevations were measured in all 27 monitoring wells by GeoTrans personnel. These elevations are provided in Table 1 and shown on Figures 1 through 8. Each layer is discussed separately below.

Layer 1 Wells

Layer 1 contains nine wells with screen elevations ranging from 812 feet to 821 feet MSL. All of these well screens intersect the water table. The groundwater elevations are displayed on Figures 1 through 2 and Chart 1. Compared to the previous event in April 2009, water table elevations have decreased in all nine wells. The average decrease was 0.4 feet from April to July 2009 and 0.9 feet from July to October 2009.

Historically, the groundwater flow direction in this layer has been to the southwest. During the July and October 2009 events, the groundwater flow was to the southwest.

Layer 2 Wells

Layer 2 contains eight wells with screen elevations ranging from 774 feet to 792 feet MSL. The groundwater potentiometric surface for this layer is displayed on Figures 3 through 4 and Chart 2. From April to July 2009, water level elevations decreased in seven wells and increased slightly in P-108. The average decrease in the seven wells was 0.3 feet while P-108 increased 0.06 feet. Water levels decreased in all wells from July to October 2009 with an average decrease of 0.9 feet.

Historically, the groundwater flow direction in this layer has been to the southwest. During the July and October 2009 events, flow was to the south-southwest.

Layer 3 Wells

Layer 3 contains seven wells with screen elevations ranging from 634 feet to 704 feet MSL. The groundwater potentiometric surface for this layer is displayed on Figures 5 through 6 and Chart 3. From April to July 2009, water elevations decreased in all seven wells an average of 0.9 feet. Water levels have continued to decrease from July to October 2009 in all the wells an average of 0.7 feet.

Historically, the groundwater flow direction in this layer has been southwesterly and becomes westerly further downgradient. The July and October 2009 groundwater flow direction is consistent with the historical results

Layer 4 Wells

Layer 4 contains three wells with screen elevations ranging from 508 feet to 570 feet MSL. The three wells in this grouping are located 375 to 2300 feet downgradient of the landfill. The groundwater potentiometric surface for this layer is displayed on Figures 7 through 8 and Chart 4. Water elevations decreased in all three wells with an average decrease of 1.6 feet from April to July 2009. Water levels continued to decrease in the three wells from July to October 2009 an average of 0.7 feet.

Historically, the groundwater flow direction in this layer has been to the southeast. Since pumping at the City of Ripon Municipal Well # 9 was terminated in May, 2007 the flow direction has been to the west. During the July and October 2009 events, flow was to the west. Subsequent to the October sampling event, the City restarted the pumping of Well # 9.

Groundwater Monitoring Event - Monitoring Well Sampling

The revised groundwater monitoring program as modified by WDNR correspondence dated July 26, 2007 was followed for the July 2009 sampling event. The revised groundwater monitoring program as modified by WDNR correspondence dated October 21, 2009 was followed for the October 2009 sampling event. A table showing the monitoring schedule for each well is provided in Attachment B. The groundwater samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260B. Analytical results and field forms are provided in Attachments C and D, respectively. The VOC analytical results for the monitoring wells are tabulated in Table 2. The temporal trend of chlorinated compound concentrations in all wells is provided in Charts 27 through 53.

Natural attenuation parameters were taken on selected wells during the October 2009 sampling event. The DO and ORP along with temperature, pH and conductivity were measured using a QED MP20 MicroPurge Flow Cell Meter. The iron II, nitrate, nitrite, sulfate and sulfide were measured in the field using CHEMetrics analyte specific Vacu-vials® for photometric analysis using a CHEMetrics Model V-2000 LED photometer. For dissolved methane, groundwater samples were collected and submitted to Pace Analytical Laboratories for analysis using AM20GAX, an enhanced version of RSK-175.

Following is a summary of the October 2009 VOC analytical results as they relate to groundwater standards for each well that was sampled. To better track impacts at various depths, the results are organized according to the four stratigraphic groupings of wells discussed previously. Natural attenuation parameters are discussed after the section on VOC analytical results.

Please note that chloromethane, which is not routinely detected at the site, was detected at low levels (1.1 to 1.6 ug/L) in 5 monitoring wells and 3 private wells in the October 2009 samples and is suspected of being a sampling or lab artifact. Chloromethane can be naturally occurring and released to the air when grass, leaves or wood are burned and may be formed in tap water that has been chlorinated (ATSDR Public Health Statement Chloromethane, December 1998).

Layer 1 Wells

- | | |
|--------|---|
| MW-101 | No detection of any VOC. |
| MW-103 | No compounds exceeded NR 140 Enforcement Standards (ES). Vinyl chloride (VC) has not been detected since May 2007. Trichloroethene (TCE) exceeded its preventative action limit (PAL) with a concentration of 2.4 ppb. Cis-1,2-dichloroethene (DCE) was detected below its PAL for the first time since April 2006. |
| MW-104 | No compounds exceeded the NR 140 PAL. VC has not been detected in this well since April 2006 and benzene has not been detected since October 2007. |
| MW-107 | Chloromethane (lab artifact) was detected above the PAL with a concentration of 1.6 ppb. |
| MW-108 | No detection of any VOC. |
| MW-111 | No detection of any VOC. |
| MW-112 | No detection of any VOC. VC has not been detected since May 2008. DCE was detected in April 2009 but was not detected in this sampling event. |

Layer 2 Wells

- | | |
|-------|---|
| P-101 | No detection of any VOC. |
| P-102 | No detection of any VOC. |
| P-103 | No detection of any VOC. VC was last detected in May 2008. |
| P-106 | No detection of any VOC. |
| P-107 | Chloromethane (lab artifact) was detected above its PAL at 1.6 ppb. |
| P-111 | No detection of any VOC. |

Layer 3 Wells

- | | |
|--------|--|
| MW-3B | No detection of any VOC. |
| P-103D | Chloromethane (lab artifact) was detected above its PAL at 1.1 ppb. |
| P-111D | VC exceeded its ES at 5.0 ppb. DCE and chloroethane were detected at concentrations below NR 140 standards. |
| P-113B | No detection of any VOC. |
| P-114 | VC exceeded its ES at 4.7 ppb which is the lowest concentration since April 2005. Chloromethane (lab artifact) was detected above its PAL at a concentration of 1.5 ppb. DCE was detected at a concentration below NR 140 standards. |
| P-115 | VC exceeded its ES at 1.3 ppb. This concentration is consistent with the last two sampling rounds and is slightly higher than previous results. Chloromethane (lab artifact) was detected above its PAL at 1.6 ppb. |
| P-116 | No detection of any VOC. |

Layer 4 Wells

- | | |
|--------|--|
| MW-3A | No detection of any VOC. |
| P-107D | VC exceeded its ES at 2.0 ppb. This concentration is lower than the last sampling round. |
| P-113A | No detection of any VOC. |

Natural Attenuation Parameters

Because VC is the sole remaining contaminant of concern and because VC reduction is most commonly an aerobic process via direct oxidation, MNA parameters that can demonstrate oxidative conditions were taken. MNA parameter monitoring was conducted on wells vertically and horizontally up-gradient, within and down-gradient of the VC plume. Based on EPA (1998) guidance iron II, nitrite, sulfide, methane, dissolved oxygen and ORP were taken as indirect evidence of natural attenuation.

The results for October 2009 show some secondary evidence that natural attenuation of VC is occurring. Sulfide was below 0.2 ppm in 80% of the Layer 3 and 4 wells. Nitrite was below 0.08 ppm in 70% of the Layer 3 and 4 wells. Methane was below 0.5 ppm in all of the Layer 3 and 4 monitoring wells.

Groundwater Monitoring Event - Private Drinking Water Well Sampling

Historically, seven private wells have been sampled. Four of these wells (Altnau, Hadel, Miller and Wiese) have either been abandoned or converted to monitoring wells. The remaining three wells (Perry/Watkins, Gaastra and Rohde) were sampled by Jack Wendler from the City of Ripon on July 22, 2009 and analyzed for volatile organic compounds (VOCs) using EPA Method 524.2 (Safe Drinking Water Act). These wells were sampled by GeoTrans personnel on October 29 and November 4, 2009. In addition to VOC analysis, the October samples were also analyzed for natural attenuation parameters including iron II, methane, nitrite and sulfite. Analytical results and field forms are provided in Attachments C and D, respectively. The VOC analytical results for the private drinking water wells are tabulated in Table 3.

During the July 2009 event, acetone was detected in the Perry/Watkins and Gaastra samples. Acetone was also detected in the Gaastra sample in October 2009. This compound is a common lab solvent and is believed to be a laboratory artifact. Chloromethane was detected below the LOQ in the Rohde sample in July. Chloromethane was also detected at low levels but above the PAL in the Rohde, Gaastra and Perry/Watkins samples in October 2009. These concentrations were very low and are believed to be a sampling or lab artifact. Chloromethane can be naturally occurring and released to the air when grass, leaves or wood are burned and may be formed in tap water that has been chlorinated.

Interim Landfill Gas Extraction System Performance Monitoring

Results of the gas monitoring are presented in Tables 3 and 4 and Charts 1-26.

Current extraction is from shallow vent GV-6 and the three deep leachate wells (LC-1, LC-2 and LC-3). The other vents have remained closed to prevent oxygen levels from increasing above 5%. One balancing modification to the daily run time cycle was made due to increasing oxygen levels above 5% in one or more extraction wells:

- August 24, 2009: the system's daily cycle was decreased to 6 hours on and 18 hours off due to oxygen levels higher than 5% in GV-6.

Gas samples for VOC analysis were collected July 27 and October 27, 2009. The results are summarized on Table 6 and the lab report is included in Attachment C. The samples show no detectable vinyl chloride in any well during either round except for at LC-3 where it was detected in both the July and October samples. Although the results show an increase in VOCs at LC-3 during the last two sampling events, VOC's have been significantly reduced since startup of the extraction system.

Monitoring of the gas probes and wells outside the limits of fill indicates that the gas extraction system has controlled gas migration from the fill area since startup in March 2006. Gas concentrations in all exterior wells and gas probes have been consistently below the methane LEL during this semi-annual period.

A pressure test was conducted on the interim landfill gas extraction system. The test was conducted on August 28, 2009 in accordance with Addendum #1: Engineering Design Plans and Specifications by GeoTrans, Inc. dated December 22, 2006. Each leg of piping was isolated and compressed air was added until a pressure of 5 pounds per square inch (PSI) was obtained. The pressure was monitored in each leg of piping for 10 minutes. The pressure readings were recorded and are located in Attachment D. Leg 1 and 3 maintained over 90 percent of the applied pressure in the 10 minute period. Leg 2 maintained over 85 percent of the applied pressure. The pressure readings indicate that the piping is functioning properly and that the minor losses noted are not significant.

UPCOMING ACTIVITIES PLANNED

Groundwater sampling, private water well sampling, water level measurements and landfill gas extraction point sampling will be conducted in January 2010. It is proposed that only monitoring wells containing vinyl chloride (P-107D, P-111D, P-114 and P-115) and the three private wells will be sampled for VOCs during the next two quarterly events.

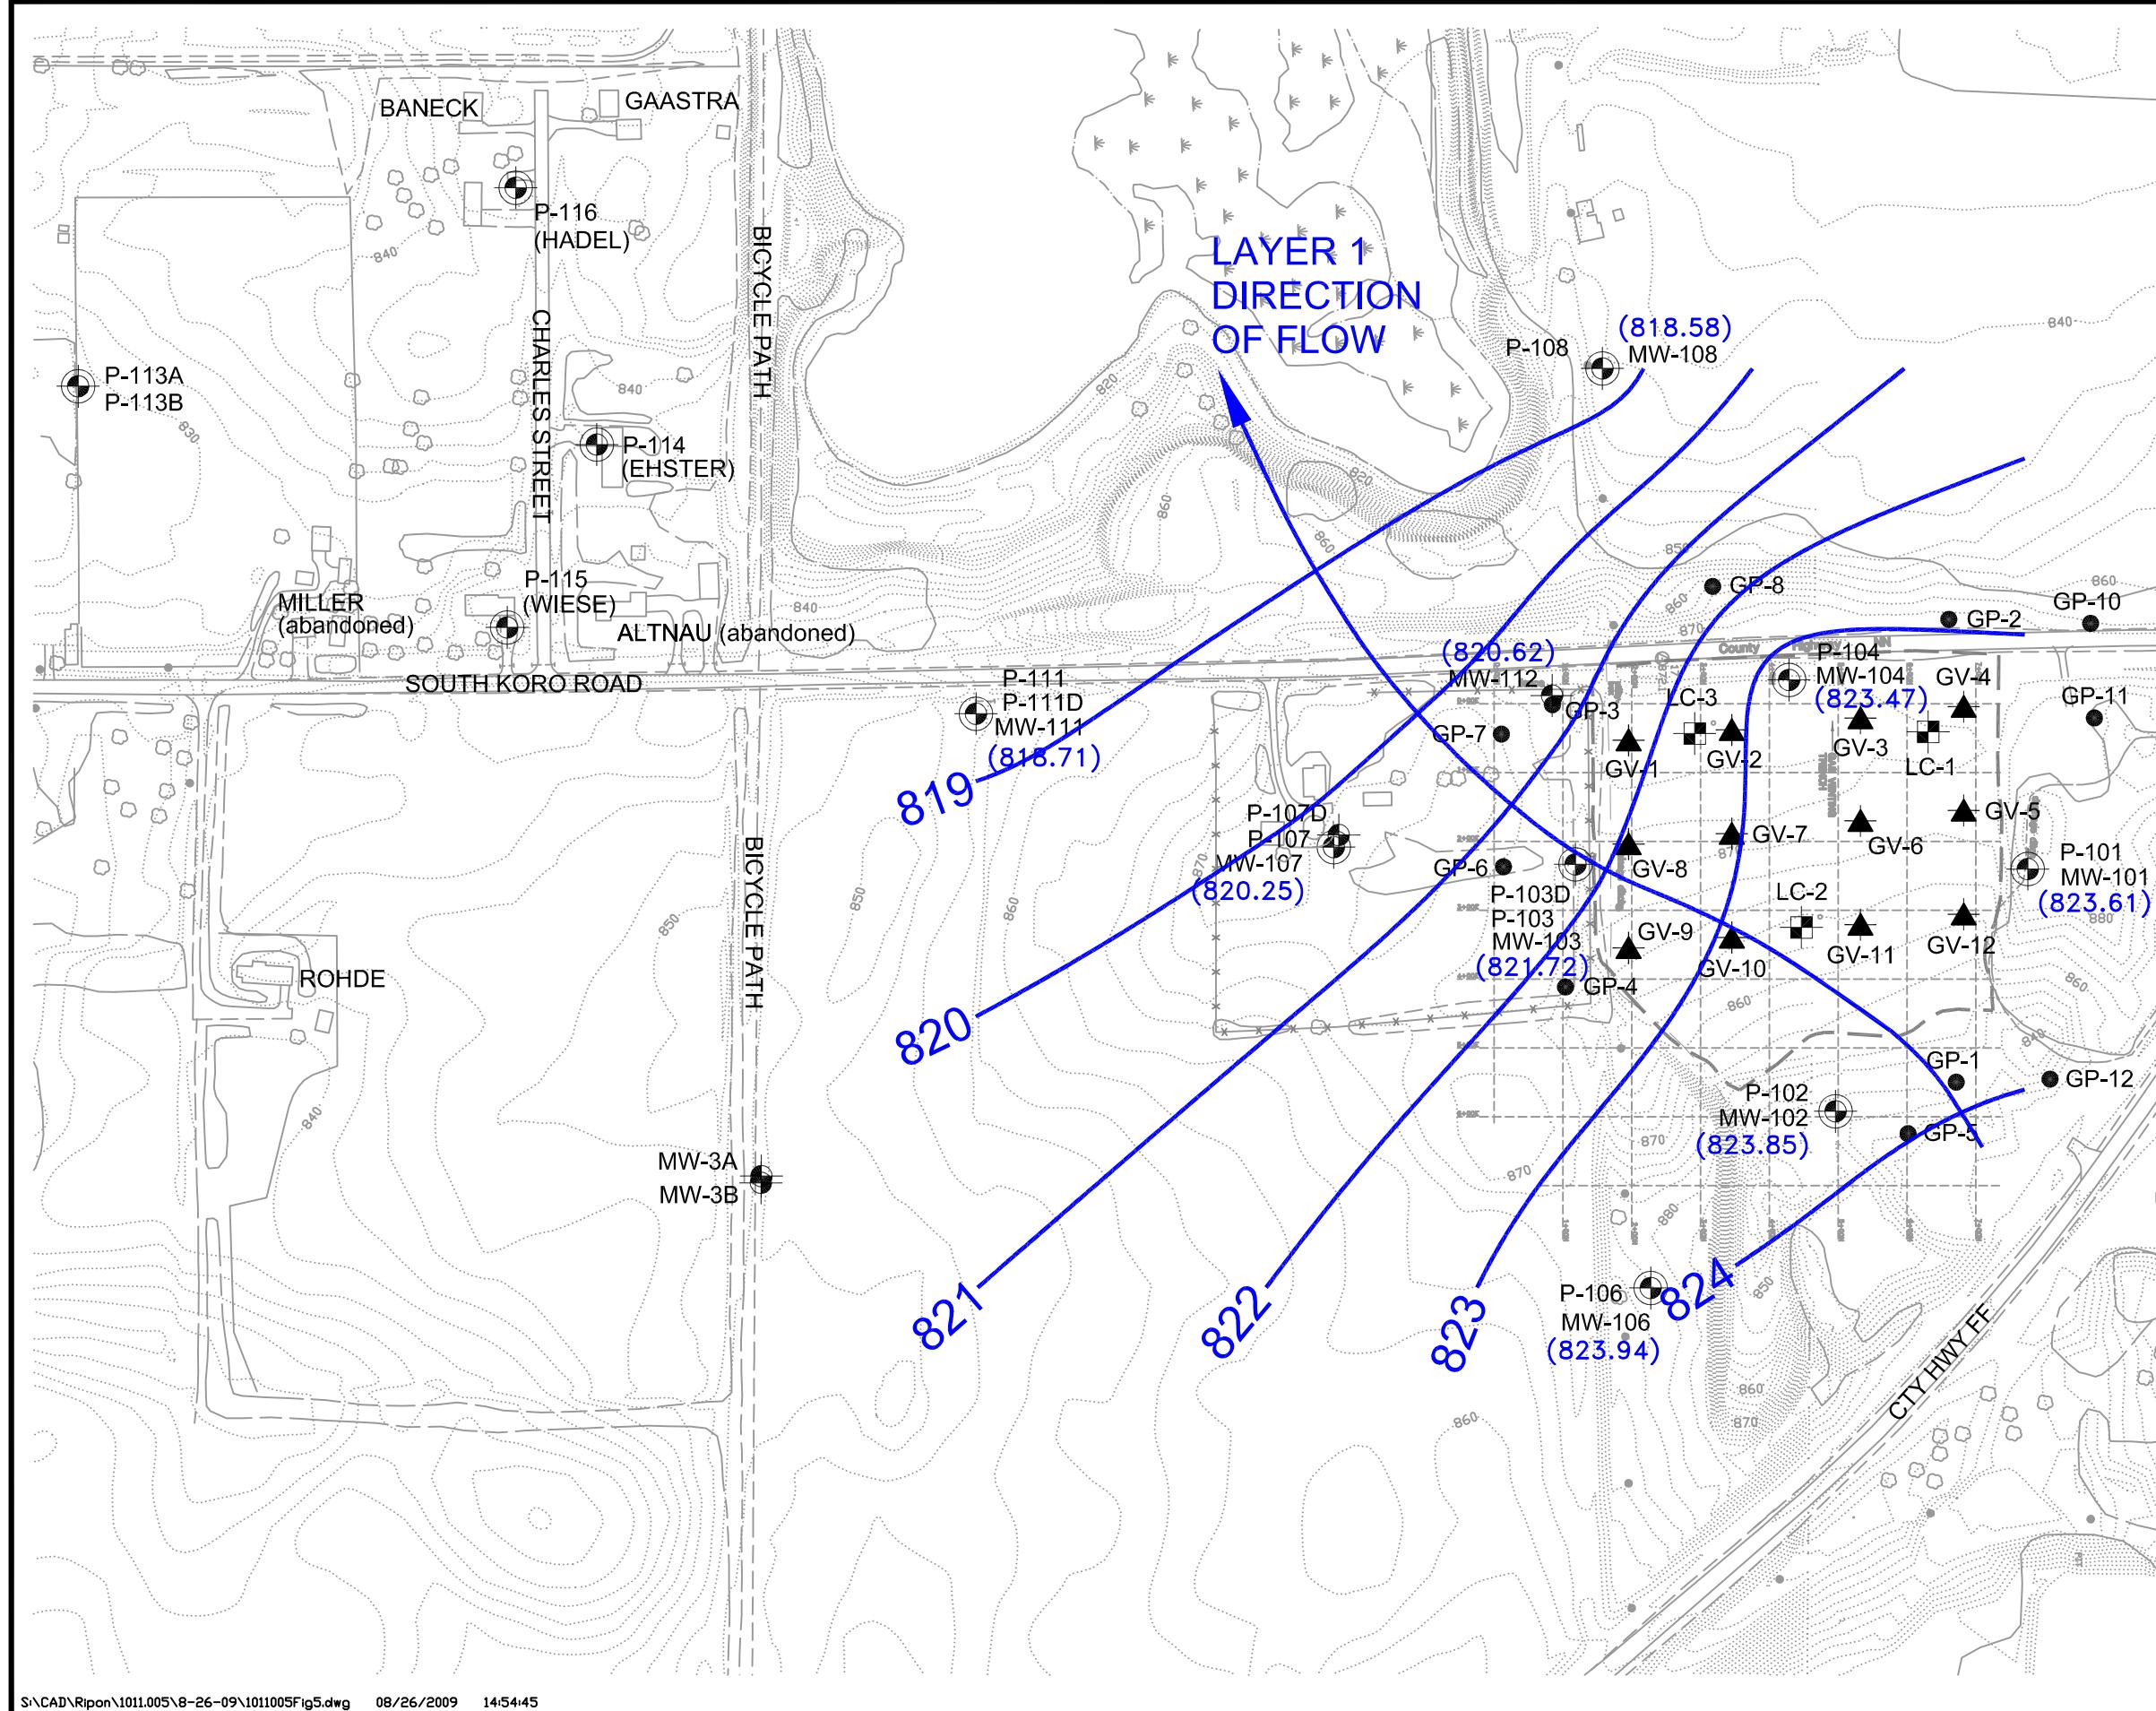

Landfill gas monitoring will be conducted periodically by Jack Wendler from the City of Ripon..

The interim gas extraction system will continue to be monitored for effectiveness throughout this quarter.

PERSONNEL

Mr. Michael Noel is the Project Manager and Principal Hydrogeologist. Mr. Kevin Lincicum is the Project Hydrogeologist who oversaw the field activities. The laboratory analyses for the July and October 2009 groundwater samples were completed by Pace Analytical Services, Inc. in Green Bay, Wisconsin. The drinking water well samples were submitted to Pace Analytical Services, Inc. in Green Bay and were analyzed by Northern Lake Service, Inc. located in Crandon, Wisconsin. The laboratory analyses for the air samples was completed by Pace Analytical Services, Inc. located in Minneapolis, Minnesota.

Notes:

Blank cells indicate that the water level was below top of pump; unable to measure.

Measurements are in Feet Above Mean Sea Level (msl)

">" indicates depth to top of pump (water level was beneath pump)

NT - Not taken, only measured deep wells

NM - Well not measured

NR140	ES	200	90	0.3	7	10	200	0.02	NE	NE	125	NE	

Underline values indicate PAL exceedance

Bold values indicate ES exceedance

Q = detected at less than quantitation limit

B= detected in trip blank

ND= not detected above the level of detection

NA = not analyzed

NR = not required to analyze

PAL = Preventive Action Limit

ES = Enforcement Standard

NE = None Established

¹ Methylene Chloride was detected and is assumed to be a laboratory artifact

² Acetone was detected and is assumed to be a laboratory artifact

³ Chloromethane was detected and is assumed to be lab introduced

Monitoring began in 1993. See prior report submittals to WDNR for results prior to 2001.

See Table 2 for monitoring wells for Ehster, Hadel and Wiese data

Table 5. Leachate VOC Analytical Results for Leachate Wells

FF/NN Landfill
Ripon, Wisconsin

Leachate Well ID	Year	Date	Benzene	2-Butanone (MEK)	Carbon Disulfide	Chlorobenzene	Chloroethane	Chloromethane	Dichlorodifluoromethane	1,2-Dichlorobenzene	1,3-Dichlorobenzene	1,4-Dichlorobenzene	1,1-Dichloroethane	cis-1,2-Dichloroethene	Ethylbenzene	Isopropylbenzene	P-isopropyl toluene	4-Methyl-2-Pentanone	Naphthalene	n-Propylbenzene	Tetrachloroethene	Tetrahydrofuran	Toluene	1,2,4-Trichlorobenzene	Trichloroethene	1,2,4-Trimethylbenzene	Vinyl Chloride	Xylenes (Total)	Methyl-t-butyl ether	Di-isopropyl ether
		Parameter																												

Notes: * = Insufficient water for sample collection

D = Analyte was identified in an analysis at a secondary dilution factor

J = Estimated Values; Below the Quantitation Limit

NA = Not analyzed

ND = Not detected

Q = Between LOD and LOQ

4/28¹ Acetone detected at 29 ug/l

4/9¹ Acetone detected at 56.9 ug/l

Many samples results indicated the presence of methylene chloride and/or acetone.

Validation of the data indicated that these compounds were not actually present in the water from the leachate wells.

These, and other compounds not detected in the samples are not included on the summary table.

All concentrations are in parts per billion (ppb)

Contaminants are not compared to NR140 Prevention Action Limits and Enforcement Standards because those standards do not apply to leachate.
