Re: Phase II Subsurface Assessment, Proposed State Highway 23 Upgrade Project, Quilt's and Quilting Right-of-Way, 607 West Main Street (STH 23), Princeton, Green Lake County, Wisconsin --  
WisDOT Project ID No. 1430-08-04 -- STS Project No. 4-27811XW

Dear Ms. Smith:

STS Consultants, Ltd. (STS) is pleased to submit this Phase II Subsurface Assessment (Phase II) for the State Highway (STH) 23 right-of-way (ROW) adjacent to the Quilt's and Quilting property located at 102 South Pearl Street in the city of Princeton, Green Lake County, Wisconsin. The site was selected for a Phase II to assess environmental conditions associated with two former underground storage tanks removed from the site in 2002.

Phase II results indicate that groundwater in the STH 23 ROW adjacent to the Quilt's and Quilting property is impacted with low levels of residual petroleum compounds above regulatory standards. Concentrations of petroleum-related compounds were not detected above regulatory limits or suggested limits.

This report was completed in accordance with Wisconsin Department of Transportation Work Order No. 53 for Project ID No. 1430-08-04.

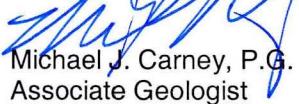

If you have any questions regarding this report, please contact Mr. Paul Garvey at (920) 406-3139.

Sincerely,

STS CONSULTANTS, LTD.

Paul M. Garvey  
Senior Project Scientist

Michael J. Carney, P.G.  
Associate Geologist

## 1.0 EXECUTIVE SUMMARY

As part of the State Highway (STH) 23 upgrade project in Princeton, Wisconsin, STS Consultants, Ltd. (STS) was retained by the Wisconsin Department of Transportation (WisDOT) to perform a Phase II Subsurface Assessment (Phase II) within the STH 23 right-of-way (ROW) adjacent to the Quilt's and Quilting (Quilt's) property. The Quilt's property is located at 607 West Main Street in the city of Princeton, Green Lake County, Wisconsin. The site was selected for a Phase II to assess environmental conditions associated with historic petroleum underground storage tanks (USTs) identified along the northern edge of the parcel. As summarized in the October 2003 Phase I Hazardous Materials Assessment (HMA), contamination was previously detected in the soil and groundwater. However, only minimal environmental investigation was conducted previously.

Groundwater samples analyzed indicated the presence of residual petroleum-related compounds above regulatory standards within the ROW adjacent to the Quilt's property. Some low-level petroleum compounds were detected in soil at concentrations below regulatory standards. Based on laboratory analytical results and field screening observations, residual petroleum compounds above generic regulatory standards or suggested standards may be encountered at low concentrations during the reconstruction of STH 23 in the vicinity of the Quilt's property.

Wisconsin Department of Transportation  
STS Project No. 4-27811XW  
May 9, 2005

## 2.0 SITE INVESTIGATION

### 2.1 Purpose of Scope

The purpose of the Phase II was to determine whether past land use practices impacted the subsurface at the Quilt's property located at 607 West Main Street in the area of the proposed STH 23 reconstruction in Princeton, Wisconsin.

A Phase I HMA completed by KL Engineering, Inc., Madison, Wisconsin, dated October 2003, indicated that gasoline USTs existed at the northern edge of the parcel and were removed from the site in 2002. The scope of the Phase II investigation included the advancement of two soil borings within the proposed project limits to sample and analyze soil and groundwater, which could be encountered during construction activities. STS selected soil boring locations based on proximity to areas of suspected environmental impact identified in the Phase I HMA and accessibility of sampling equipment.

According to the Phase I, project reconstruction plans call for roadway reconstruction as well as excavation for utility installation adjacent to the Quilt's property. A sanitary sewer will be installed by the City of Princeton in the center of STH 23 (West Main Street) at a depth of approximately 10 feet near the site. The WisDOT portion of the utility installation includes a storm sewer on the north side of STH 23 to a depth of approximately 6 feet below ground surface (bgs) and water piping on the south side of the street at a depth of approximately 7 feet bgs near the site.

A site location map and soil boring location map are presented on Figures 1 and 2 (Section 2.3). Photos of the site and boring locations are included in Appendix 3.1.

### 2.2 Investigation Program

On March 21, 2005, STS personnel accessed the ROW adjacent to the Quilt's property to collect soil and groundwater samples within the proposed project limits. STS retained a subcontract direct push firm (Kitson Environmental Services, Inc., Helenville, Wisconsin) to advance the borings. Two direct push borings (GP-4 and GP-5) were advanced. Soil borings were advanced to a depth of approximately 3 feet below the proposed WisDOT utility installation depth and were terminated at a depth of approximately 10 feet bgs. The water table was encountered in Borings GP-4 through GP-5 at a depth of approximately 4 feet bgs.

Wisconsin Department of Transportation  
STS Project No. 4-27811XW  
May 9, 2005

Soil samples were collected from the borings using standard direct-push technology with a power-driver sampling spoon. A single-use disposable acetate liner was placed in each spoon, and the spoon was advanced to the desired depth. The spoon was then retrieved from the boring, the acetate liner extracted from the spoon, and the liner cut open to allow removal of the sample. Soil samples were collected continuously from the ground surface to boring termination depths. Soil samples recovered from the borings were field-screened with a photoionization detector (PID), which was equipped with a 10.6-electron volt lamp. Soil PID field screening results are indicated on the soil boring log information forms (Appendix 3.2). Following completion of sampling, the borings were abandoned with granular bentonite. Wisconsin Department of Natural Resources (WDNR) Well/Drillhole/Borehole Abandonment forms were prepared to record abandonment activities (Appendix 3.3).

Selected soil samples were prepared in the field and submitted to En Chem, Inc./Pace Laboratories (En Chem), Green Bay, Wisconsin, for analysis of one or more of the following analytes:

- ◆ Volatile organic compounds (VOCs) (EPA Method 8260B)
- ◆ Petroleum volatile organic compounds (PVOCs) (EPA Method 8021)
- ◆ Polynuclear aromatic hydrocarbons (PAHs) (EPA Method 8270C)
- ◆ Diesel range organics (DRO) (Wisconsin modified method)
- ◆ Gasoline range organics (GRO) (Wisconsin modified method)
- ◆ Cadmium, chromium, and lead (Method 6020)

Following completion of soil sampling, a 1-inch-diameter stainless steel Geoprobe well screen was installed in Borings GP-4 and GP-5 to facilitate groundwater collection. Approximately 1 to 2 gallons of groundwater were purged from the temporary wells using disposable high density polyethylene (HDPE) tubing and a peristaltic pump. Groundwater samples were collected in containers provided by the analytical laboratory. A portion of the groundwater sample was field-filtered for dissolved lead. The groundwater samples were submitted to En Chem for analysis of:

- ◆ VOCs (EPA Method 8260B)
- ◆ PAHs (EPA Method 8270C)
- ◆ Dissolved lead (Method 6010B)

Wisconsin Department of Transportation  
STS Project No. 4-27811XW  
May 9, 2005

Laboratory analytical reports and Chain of Custody forms are included in Section 3.4 of the Appendix.

### 2.3 Site Maps

Figure 1 shows the location of the site on a portion of the United States Geological Survey (USGS) 7.5-minute topographic quadrangle map of east and west Princeton, Wisconsin. Figure 2 is a site diagram, which illustrates the locations of the borings completed during the Phase II activities.

### 2.4 Geology

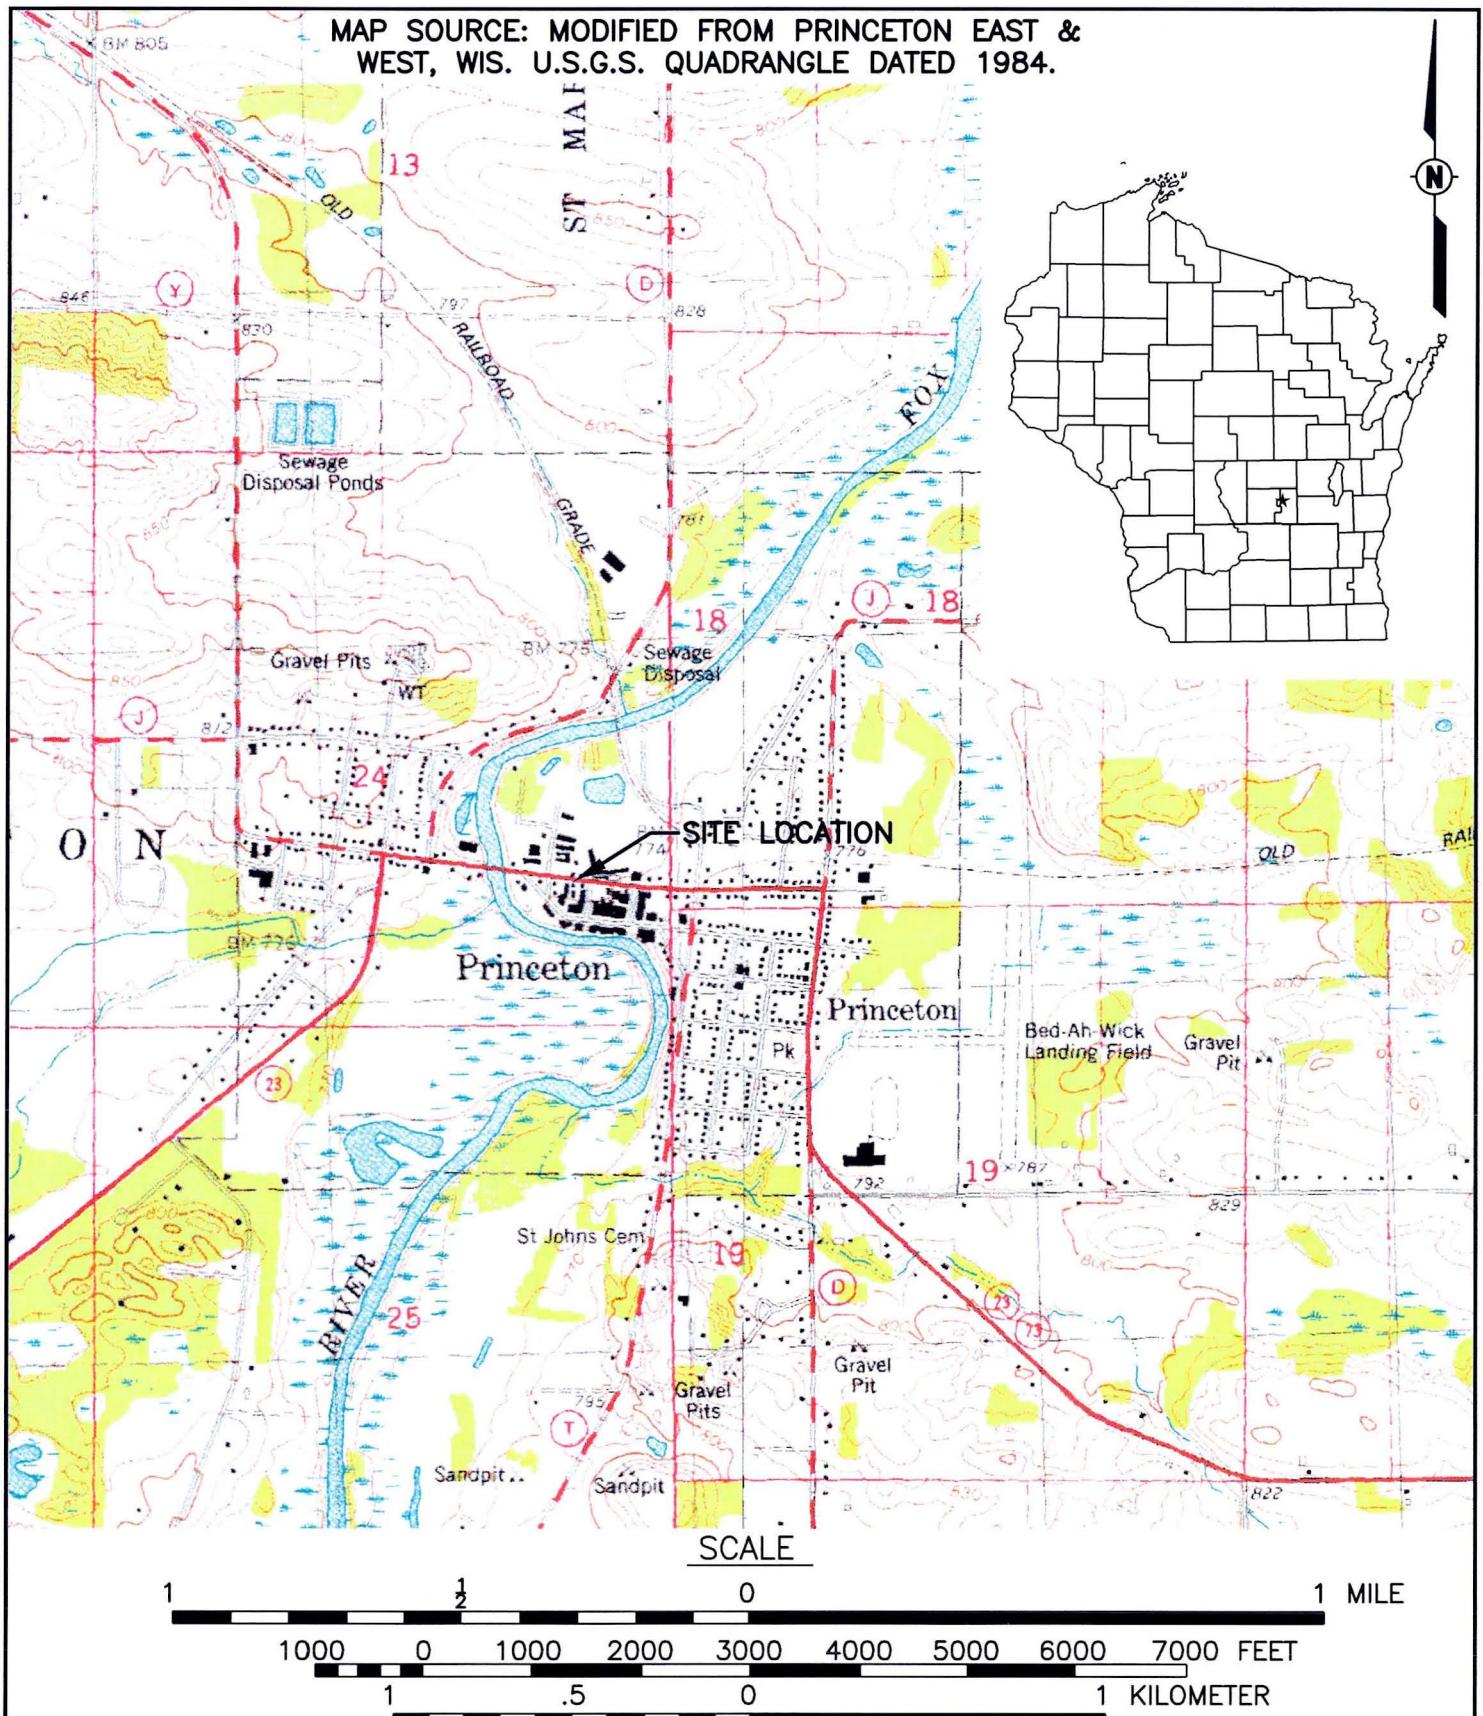

Review of the Department of the Interior, USGS Publication *Water Resources of Wisconsin, Fox-Wolf River Basin, Hydrogeologic Investigations, Atlas HA-321, Sheet 1 of 4, 1968*, indicated that the subject property is an area of glacial lake deposits (clay, silt, and sand) that overlie bedrock, which mostly consists of sandstone. The thickness of the glacial lake deposits over the bedrock is approximately 100 feet.

The USDA Soil Survey of Greendale County, Wisconsin, (1977) indicated that the native surficial soil in the area of the US Bank property is Oakville fine sand. The Oakville Series is described as nearly level to steep well-drained soils on outwash plains and terraces and in old glacial lake basins and of eolian sand deposits on till uplands. Permeability is very rapid and surface runoff is slow.

Regional groundwater flow direction is likely south-southwest toward the Fox River (*Water Resources of Wisconsin, Fox-Wolf River Basin, Hydrogeologic Investigations, Atlas HA-321, Sheet 1 of 4, 1968*). Existing ditches, underground utilities (such as sanitary/storm sewer piping systems), and other natural and manmade features may influence local groundwater flow direction. Site-specific groundwater flow direction cannot be determined without installation of monitoring wells.

A review of the Princeton East, Wisconsin, USGS 7.5-minute topographic map dated 1984 showed the Quilt's property as being located in an area that generally slopes to the south and west and at an elevation of approximately +780 feet above mean sea level (MSL).

## 2.5 Results

Soils encountered at Borings GP-4 and GP-5 consisted of approximately 6 feet of silty sand fill material overlying an organic silt layer approximately 1.5 feet thick, followed by a clayey silt native material to the boring termination depth. Groundwater was encountered while sampling at the 4-foot depth interval. PID readings from soil collected and screened from Boring GP-5 indicated elevated PID readings (>10 PID units) from the 6-foot to 8-foot depth interval (in the saturated zone). PID readings from soil collected and screened from Boring GP-4 was less than 1 PID unit. PID screening results for soil samples are summarized on the Soil Boring Log Information forms in Section 3.2 of the Appendix.

Soil laboratory analytical results are summarized on Table 1 and the laboratory report included in Section 3.4 of the Appendix. Soil analytical results indicate that petroleum-related compounds generally consisting of lighter PAHs (naphthalenes) were detected above background concentrations in Borings GP-4 and GP-5. GRO, DRO, and VOCs were not detected. Metals (including cadmium, chromium, and lead) were detected at levels characteristic of background concentrations. As shown on Table 1, no soil regulatory standards or suggested standards were exceeded.

Water sample results from Geoprobe Borings GP-4 and GP-5 are summarized on Table 2. PAHs including benzo(a)pyrene, benzo(b)fluoranthene, and chrysene were detected above Wisconsin Administrative Code Chapter NR 140 enforcement standards (ESs) in GP-4 at concentrations above the NR 140 ESs. Lead was not detected above regulatory standards. VOCs were not detected above method detection limits. Benzo(a)pyrene, benzo(b)fluoranthene, and chrysene were also detected above their respective NR 140 Preventive Action Limits (PALs) in GP-5. No other PAHs were detected above regulatory standards.

Laboratory reports are included in Section 3.4 of the Appendix.

## 2.6 Conclusions

Soils encountered in Borings GP-4 and GP-5 near the Quilt's property consisted primarily of fine sands to a depth of approximately 6 feet overlying an organic layer and natural silts. Groundwater was encountered at a depth of approximately 4 feet bgs while sampling. PID field screening results indicated elevated detection in Boring GP-5. Elevated PID detections were not recorded in Boring GP-4. PID screening results for soil samples are summarized on the WDNR soil boring log information forms in Section 3.2 of the Appendix.

<sup>1</sup>WAC NR 140 PHGWQ Standards = Wisconsin Administrative Code Chapter NR 140 Public Health Groundwater Quality Standards

Wisconsin Department of Transportation  
STS Project No. 4-27811XW  
May 9, 2005

Laboratory analytical results for groundwater indicate petroleum-related compounds are present at concentrations above regulatory standards. Analytical results at GP-4 and GP-5 indicate that some PAHs were detected in soil at concentrations below regulatory standards or suggested regulatory standards. The lighter PAHs detected in soil suggest possible residual diesel fuel impacts.

## **2.7 Recommendations**

STS recommends that WisDOT complete Phase 2.5 standard special provisions for encountering impacted soil and groundwater during the reconstruction of STH 23 to address the potential for encountering petroleum and lead-impacted soil and groundwater during construction.

STS also recommends that WisDOT notify the WDNR of soil and groundwater regulatory exceedances detected for petroleum-related compounds.

## **2.8 General Qualifications**

Conclusions presented in this report are based on field observations documented in the Phase I HMA report and subsurface conditions as revealed in the soil borings at locations identified on the figures. Stratification lines shown on the boring logs (Section 3.1) represent approximate boundaries between soil types. Variations may exist in both the horizontal and vertical directions between boring locations. In addition, seasonal and annual fluctuations of the groundwater table may influence distribution of compounds in the subsurface environment causing variations in groundwater quality.

STS has prepared this report at the request of our client. STS assumes responsibility for the accuracy of the contents of this report, subject to what is stated elsewhere in this section, but recommends this report be used only for the purposes intended by the client and STS at the time this report was prepared. This report may be unsuitable for other uses, and reliance on its content by anyone other than the client is done at the sole risk of the user. Our interpretations of results represent our scientific judgment based on available information. No other warranty is either expressed or implied, is made.

Lab Number	TestGroupID	Field ID	Comment
857394-001	DRO-S	GP-1 (2-4)	Front eluting peaks, late eluting hump and diesel range peaks were present in the chromatogram.
857394-001	GRO-S-ME	GP-1 (2-4)	Early and late eluting peaks were present outside the window of analysis.
857394-003	DRO-S	GP-2 (2-4)	Late eluting hump along with diesel range peaks were present in the chromatogram.
857394-005	DRO-S	GP-3 (2-4)	Late eluting hump along with diesel range peaks were present in the chromatogram.
857394-011	DRO-S	GP-6 (4-6)	Late eluting hump along with diesel range peaks were present in the chromatogram.
857394-011	DRO-S	GP-6 (4-6)	DRO response was not in the upper half of the curve due to the high concentration of late eluting hydrocarbons.
857394-013	DRO-S	GP-7 (4-6)	Late eluting hump along with diesel range peaks were present in the chromatogram.
857394-020	M-PB-D	GP-2	C - Elevated detection limit due to matrix effect.

## Qualifier Codes

Flag	Applies To	Explanation
A	Inorganic	Analyte is detected in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
B	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
B	Organic	Analyte is present in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
C	All	Elevated detection limit.
D	All	Analyte value from diluted analysis or surrogate result not applicable due to sample dilution.
E	Inorganic	Estimated concentration due to matrix interferences. During the metals analysis the serial dilution failed to meet the established control limits of 0-10%. The sample concentration is greater than 50 times the IDL for analysis done on the ICP or 100 times the IDL for analysis done on the ICP-MS. The result was flagged with the E qualifier to indicate that a physical interference was observed.
E	Organic	Analyte concentration exceeds calibration range.
F	Inorganic	Due to potential interferences for this analysis by Inductively Coupled Plasma techniques (SW-846 Method 6010), this analyte has been confirmed by and reported from an alternate method.
F	Organic	Surrogate results outside control criteria.
G	All	The result is estimated because the concentration is less than the lowest calibration standard concentration utilized in the initial calibration. The method detection limit is less than the reporting limit specified for this project.
H	All	Preservation, extraction or analysis performed past holding time.
HF	Inorganic	This test is considered a field parameter, and the recommended holding time is 15 minutes from collection. The analysis was performed in the laboratory beyond the recommended holding time.
J	All	Concentration detected equal to or greater than the method detection limit but less than the reporting limit.
K	Inorganic	Sample received unpreserved. Sample was either preserved at the time of receipt or at the time of sample preparation.
K	Organic	Detection limit may be elevated due to the presence of an unrequested analyte.
L	All	Elevated detection limit due to low sample volume.
M	Organic	Sample pH was greater than 2
N	All	Spiked sample recovery not within control limits.
O	Organic	Sample received overweight.
P	Organic	The relative percent difference between the two columns for detected concentrations was greater than 40%.
Q	All	The analyte has been detected between the limit of detection (LOD) and limit of quantitation (LOQ). The results are qualified due to the uncertainty of analyte concentrations within this range.
S	Organic	The relative percent difference between quantitation and confirmation columns exceeds internal quality control criteria. Because the result is unconfirmed, it has been reported as a non-detect with an elevated detection limit.
T	All	Inadequate sample volume received to perform the method required MS/MSD.
U	All	The analyte was not detected at or above the reporting limit.
V	All	Sample received with headspace.
W	All	A second aliquot of sample was analyzed from a container with headspace.
X	All	See Sample Narrative.
&	All	Laboratory Control Spike recovery not within control limits.
*	All	Precision not within control limits.
<	All	The analyte was not detected at or above the reporting limit.
1	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses passed QC based on precision criteria.
2	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses failed QC based on precision criteria.
3	Inorganic	BOD result is estimated due to the BOD blank exceeding the allowable oxygen depletion.
4	Inorganic	BOD duplicate precision not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
5	Inorganic	BOD result is estimated due to insufficient oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
6	Inorganic	BOD laboratory control sample not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
7	Inorganic	BOD result is estimated due to complete oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
