Re: Environmental Monitoring and Assessment Status Report
Former Gunderson Cleaners
118 High Avenue
Oshkosh, WI 54901
BRRTS#: 02-71-467002

Dear Mr. McKnight:

EnviroForensics, LLC is pleased to submit this Environmental Monitoring and Assessment Status Report (Report) for the former Gunderson Cleaners site located at 118 High Avenue in Oshkosh, Wisconsin. An electronic version has been uploaded to the RR Program document submittal portal. Per WDNR guidance, the requirement to submit a paper copy of the report is currently suspended. The Report has been prepared to document the results of recent monitoring and assessment activities completed by EnviroForensics, and to propose next steps for the site. On behalf of Gunderson Cleaners, EnviroForensics is requesting a formal review of the Report and written response to the conclusions and recommendations described therein. The technical assistance review fee of $700 will be sent to the northeast region program associate.

Sincerely,
EnviroForensics, LLC

Brian Kappen, PG
Project Manager

Re: Environmental Monitoring and Assessment Status Report
Former Gunderson Cleaners
118 High Avenue
Oshkosh, WI 54901
BRRTS#: 02-71-467002

Dear Mr. Gunderson:

EnviroForensics, LLC (EnviroForensics) is pleased to provide this Status Report for the former Gunderson Cleaners located at 118 High Avenue in Oshkosh, Wisconsin (the Site). Site investigation and remediation activities have been ongoing since 2003 in accordance with Wisconsin Department of Natural Resources (WDNR) NR 700 series rules to address subsurface impacts from the contaminants of concern: tetrachloroethene (PCE), and its associated breakdown compounds. EnviroForensics performed additional monitoring and assessment activities between June 2021 and May 2022.

SITE USE AND DESCRIPTION

The Site is located near the commercial district of downtown Oshkosh, identified by Parcel #90100870000. The Site lies east of the intersection of High Avenue and Brown Street, and is bordered by an alley to the north and a commercial property occupied by a photography studio to the east. The Site measures 120 by 90 feet and is currently a vacant lot with gravel surface. The layout of the Site and surrounding properties is shown on **Figure 1**.

According to historical documents, the former building was originally constructed in the 1920's and occupied by King's Laundry. We estimate dry cleaning operations were conducted at the Site from approximately the 1940's through the mid-1980's, most recently by Gunderson Cleaners. Tetrachloroethene (PCE) and Stoddard solvent were used for cleaning. Stoddard solvent was stored in a 2,000 gallon underground storage tank (UST) located near the east

corner of the former building. The UST was reportedly closed-in-place in 1966. PCE solvent was stored near the dry cleaning machine location and possibly in USTs beneath the building.

According to previous investigation reports, the Site geology consists of "…stiff silty clay with abundant sand and gravel, estimated at between 30 percent and 50 percent. The silty clay is highly plastic and has a low permeability, but there are occasional thin 0.5-foot thick silt layers at approximately 7 to 9.5 feet, and silt to fine sand layers up to 1.5 foot thick encountered at depths of 15.5 to 17 feet below grade. A more permeable and thicker sandy silt layer was noted east of the (former) building and to the south of High Avenue at depths of up to 23 feet." Bedrock was not encountered within 35 feet of the ground surface, which was the maximum depth investigated.

INVESTIGATION/REMEDIATION HISTORY

A chronological summary of contamination discovery, investigation, and remedial action is detailed below, based on information available in the WDNR project file.

2000	Two (2) soil borings were advanced along the edge of the sidewalk southwest of the Site by the Wisconsin Department Transportation (WDOT) as part of High Avenue reconstruction. Gasoline range organics (GRO), diesel range organics (DRO), and xylenes were detected in one (1) sample collected from 6-8 feet below ground surface (bgs) at concentrations above residential soil cleanup standards established at the time.
2001	Three (3) test pits were dug along the north side of High Avenue for evaluation of contamination during replacement of utilities. PID screening indicated volatile vapors in soil. The report also indicated a clay plug/dam was installed within the backfill of the sanitary sewer main in High Avenue just downstream of the lateral to 114 High Avenue (Thompson Studio). The plug was intended to prevent contaminant migration within the permeable backfill material.
2003	Subsurface contamination associated with dry cleaning solvents used at the Site was first detected in a limited Phase II Environmental Site Assessment.
July 2003	The WDNR was notified of the release and issued a responsible party (RP) letter on July 14, 2003.
April 2004	Additional site investigation activities were performed consisting of seven (7) soil borings and seven (7) soil samples. PCE and Stoddard solvent-related compounds were detected in soil samples. The samples were also analyzed for polycyclic aromatic hydrocarbons (PAHs) but none were detected.

September 2004	Additional site investigation activities were performed consisting of 11 soil borings; and the installation of seven (7) water table monitoring wells, one (1) piezometer, and two (2) temporary wells inside the building. A sample collected from a 6-8 feet bgs in a boring north of the former dry cleaning machine location contained PCE and trichloroethene (TCE) at concentrations of 1,520 mg/kg and 152 mg/kg, respectively, indicating a release source area. Elevated concentrations of VOCs were also detected in groundwater under the building, and to the south (across High Avenue) and southeast (on the south side of the Thompson Studio building).
April 2006	Eight (8) soil borings, four (4) monitoring wells, and one (1) piezometer were installed to further define the extent of impacts to the north and south, including on the opposite side of High Avenue. The sanitary sewer main in High Avenue is suspected to be a main migration corridor for PCE released from an identified, off-site source located at 135 High Avenue.
August – October 2007	Grab samples of water from sumps in the former site building and the Grand theater building (100 High Avenue) were collected; two (2) monitoring well nests were installed to further define the extent of impacts in groundwater to the south and east of the Site; and sub-slab vapor samples were collected from seven (7) locations within the site building.
July 2008	Vapor intrusion assessments were conducted at the Grand, Thompson Studio, and Sparr building (103 High Avenue). The concentration of PCE in one of the Grand theater sub-slab vapor samples exceeded the current vapor risk screening level (VRSL).
February 2009	The Site Investigation Report was issued.
September 2009	Ten (10) additional soil borings were advanced, including six (6) in High Avenue and two (2) in Brown Street to evaluate subsurface impacts along preferential pathways. Based on the magnitude of PCE detected south of High Avenue, the impacts appeared to be associated with the off-site source at 135 High Avenue. Additionally, a vapor mitigation system was installed in the Thompson Studio building, consisting of a fan connected to the existing drainage system and sump. There was no vacuum response in the two permanent vapor monitoring points with the fan operating, indicating little to no pressure field extension beneath the slab.
March 2010	An Amendment to the Site Investigation Report was issued.
June – July 2011	Soil, soil gas, and grab water samples were collected from 11 locations in High Avenue and Market Street southeast of the site. An air sample was collected from the Thompson Studio building and two (2) sumps in the Grand were sampled for vapor (headspace).

June 2012	A Supplemental Investigation Results and Proposed Remedial Action report was issued.
August 2012	Soil borings were completed inside the building to define limits of hazardous waste for disposal purposes.
October 2012	The building was demolished in preparation for remediation.
October-November 2012	Remediation occurred, consisting of excavation and off-site disposal. The hot-spot soils were mixed in place with potassium permanganate to reduce concentrations in order to avoid hazardous waste disposal. A UST was discovered in the source area along with additional unknown sanitary laterals that appeared to be source(s) of release. Two 1,000 gallon USTs were also discovered near the northeast corner of the Site and removed. These appeared to have been process tanks related to cleaning, containing PCE and/or Stoddard solvent.
November 2012 – January 2017	More soil borings were completed in the right-of-way, and post-remediation groundwater monitoring events were performed.
November 2017	Sub-slab vapor sampling was performed in the Thompson Studio, Grand theater, and Sparr buildings.
June 2021	A groundwater monitoring event was performed, and vapor intrusion monitoring was completed at Thompson Studio, Grand theater, and Sparr buildings.
November 2021	A groundwater monitoring event was conducted.
January 2022	Vapor intrusion monitoring was completed at Thompson Studio, Grand theater, and Sparr buildings.
May 2022	A groundwater monitoring event was conducted, and potential vapor migration in sanitary sewer mains north and south of the Site was assessed.

There is strong evidence that contamination originating from 135 High Avenue, the location of another former dry cleaner, has contributed to the CVOC impacts detected within the High Avenue right-of-way. That property is identified as Gillen LLC, BRRTS# 02-71-519535. The responsible party for the 135 High Avenue property is non-responsive to WDNR requests for further investigation and remediation, and the state filed a deed affidavit on the property associated with environmental cleanup obligations.

The primary migration pathway for contaminated vapor and groundwater originating at both sites appears to be along the permeable backfill around the utility corridors in the right-of-way. As part of the Site investigation, impacts were traced along the sanitary sewer as far as Market

Street south of High Avenue. (Note: the extent was apparently defined by groundwater grab samples collected near the intersection of Market Street and Pearl Avenue). Figures from the 2012 *Supplemental Investigation Results and Proposed Remedial Action* document depicting the extent and distribution of contamination are provided in **Attachment 1**.

2021-2022 MONITORING AND ASSESSMENT ACTIVITIES

Vapor Intrusion Assessments

EnviroForensics coordinated access to conduct further vapor intrusion (VI) assessment at three (3) potentially affected properties:

- Thompson Studio, 114 High Avenue
- Grand theater, 100-106 High Avenue
- Sparr Building, 103 High Avenue

VI assessments consisted of building inspections and indoor air/sub-slab vapor sampling. The assessed properties are identified on **Figure 2**. All VI assessment activities were conducted in accordance with WDNR guidance, including Publication RR-800: *Addressing Vapor Intrusion at Remediation & Redevelopment Sites in Wisconsin*. Per the guidance for assessing commercial properties, EnviroForensics completed two (2) sampling events, one (1) of which was conducted during the winter heating months. The quantity of samples collected from each structure is detailed in the table below.

Address	Property Use	Indoor Air Samples	Sub-Slab Vapor Samples
100-106 High Avenue	Commercial	2	3
103 High Avenue	Commercial	2	2
114 High Avenue	Commercial	1	2

Indoor air samples were collected in individually certified 6-liter vacuum canisters positioned within the breathing space, 3-5 feet above the floor surface. Sample collection occurred over an 8-hour period. Samples were submitted to a laboratory under chain-of-custody for analysis of select VOCs related to dry cleaning solvent according to EPA Test Method TO-15.

Permanent Vapor Pin® sub-slab vapor sampling ports were installed in the floor slab of each structure. Three ports were installed in the Grand theater; and two ports each were installed in

the Thompson Studio and Sparr building. The approximate vapor sample port locations are depicted on **Figure 2**. To ensure that the sub-slab vapor samples were representative of subsurface conditions, water dam leak testing was performed at each sample port. The integrity of the sample tubing and fittings was verified prior to sample collection by conducting a negative pressure test. Samples of sub-slab vapor were collected in 1-liter vacuum canisters and submitted to an environmental laboratory for analysis of select VOCs related to dry cleaning solvent according to U.S. EPA Method TO-15.

The indoor air and sub-slab vapor results are summarized and compared to Vapor Action Levels (VALs) and Vapor Risk Screening Levels (VRSLs), respectively, in **Table 1**. Previous VI data collected in 2008 and 2017 are also listed in **Table 1** for reference. The 2021- 2022 sample results are illustrated on **Figure 2**. The complete laboratory reports are presented in **Attachment 2**.

The contaminants of concern were not detected in any of the indoor air samples collected by EnviroForensics in any of the buildings. The sub-slab vapor samples each contained PCE, TCE, and/or cis-1,2-dichloroethene, but at concentrations less than their respective VRSLs. The highest CVOC concentrations in vapor were detected in samples VP-H (collected from the lower level of the Thompson Studio) and VP-N (collected from the west side of the Sparr building basement).

Additionally, a right-of-way work permit was secured for collecting vapor samples from the sanitary sewer mains at four (4) locations. Sewer vapor samples designated SSG-1 through SSG-4 were collected from the manhole locations identified on **Figure 2** according to the methods described in WDNR Publication RR-649: *Guidance for Documenting the Investigation of Human-made Preferential Pathways Including Utility Corridors* (June, 2021). The sewer vapor samples were collected using batch-certified clean 1-liter vacuum canisters, regulated to withdraw a sample at no more than 200 milliliter per minute (ml/min). The sewer vapor samples were submitted to EnvisionAir laboratory for analysis of tetrachloroethene (PCE) and related compounds according to US EPA Method TO-15. The contaminants of concern were not detected in any of the sewer vapor samples.

Groundwater Monitoring

EnviroForensics performed three (3) groundwater monitoring events: in June and November 2021, and May 2022. The first event included sample collection from all existing monitoring wells and piezometers to get a complete snapshot of groundwater conditions. The subsequent monitoring events included sample collection from select wells deemed important to evaluating source concentrations, migration, and extent of impacts. Samples were also collected from two

wells installed within the backfill of excavation areas, identified as Sump North and Sump South.
EnviroForensics staff measured depth to water in each well and piezometer to the nearest 0.01 of a foot using an electronic sounding device and recorded on sampling forms prior to sample collection activities during each event. Purging and sampling was completed using new, disposable bailers. Field parameters including pH, specific conductivity, temperature, oxidation-reduction potential (ORP), and dissolved oxygen (DO) were measured during purging and recorded on a sampling form. Monitoring wells were purged dry and allowed to recharge for a minimum of four (4) hours.

Groundwater samples were collected in laboratory-provided containers containing hydrochloric acid preservative and placed into a cooler with ice. Samples were submitted under appropriate chain-of-custody procedures to a state-certified laboratory for analysis of VOCs according to U.S. EPA SW Method 8260. For quality assurance/quality control (QA/QC) purposes, duplicate and equipment blank samples were collected at a frequency of one (1) sample per ten (10) investigative samples during each monitoring event. Additionally, samples from select wells were analyzed for ethene, ethane, and methane; and dehalococcoides population and functional genes to evaluate the potential for continued microbial degradation of residual CVOC impacts.

Groundwater depth and elevation data are summarized on **Table 2**. Average depth to water in wells screened across the water table ranged from 4.3 feet at MW-112 to 8.6 at MW-116. The piezometric surface indicated by the deeper pizeometers was 0.7 to 2.1 feet deeper than the water table at all locations, indicating a downward vertical gradient. Water table elevation contours for each of the three (3) monitoring events are depicted on **Figures 3, 4, and 5**. The apparent direction of groundwater flow is consistently southwest, toward the Fox River which is approximately 1,100 feet from the Site at its closest point.

Groundwater sample analytical results are summarized and compared to regulatory criteria in **Table 3** and **Figure 6**. For reference, **Table 3** includes groundwater monitoring data reported since the beginning of the Site investigation in 2004. The complete laboratory reports for recent samples collected by EnviroForensics are presented in **Attachment 3**. Notable on-site and near-site contaminant concentration data and trends are as follows:

- Sump South, placed in the backfill of the source excavation, still exhibits elevated concentrations of PCE, TCE, and cis-1,2-DCE, indicating residual mass around the boundaries of the southernmost excavation area.
- Concentrations in Sump North, placed in the backfill of the excavation area in the alley, have decreased to nearly non-detect from initially greater than 200 µg/L (of PCE).

- At MW-106, just downgradient of the source area, PCE is just above its ES while TCE and cis-1,2-DCE are less than their respective ESs.
- MW-102 exhibits a decreasing PCE concentration trend, with no other compounds detected.
- At MW-103, the cis-1,2-DCE concentration decreased following excavation and the concentrations of all CVOCs are currently less than ESs.
- At MW-108, located just outside the excavation area in the alley north of the Site, CVOC concentrations increased following remediation but are currently stable, with PCE between approximately 30-40 µg/L and TCE around its ES.

Notable downgradient concentration data and trends are as follows (note: contribution from the 135 High Avenue release to these monitoring points is likely):

- At MW-104, located directly downgradient on the south side of High Ave, the concentrations of all CVOCs have decreased nearly an order of magnitude relative to pre-remediation values.
- MW-116 continues to have the highest PCE concentration (>1,000 µg/L), however, the concentration appears to be stable.
- Conflicting contaminant trends are apparent at MW-110, where the PCE concentration has more than doubled since immediately after remediation, while cis-1,2-DCE decreased by 90%. In addition, the water table elevation measured in MW-110 is inconsistent with surrounding wells as shown on the water table contour maps.
    - PCE is the predominant compound detected in monitoring wells MW-110 and MW-116 (located across High Avenue from each other), suggesting a subsurface connection to the right-of-way backfill.
- Samples collected from the furthest downgradient wells MW-112 and MW-113 are non-detect.

The CVOC concentration trends at key monitoring points are illustrated in the attached **Charts**.

A summary of data collected for purposes of assessing natural attenuation potential is presented in **Table 4**. Samples for analysis of dehalococcoides population and functional genes were collected from MW-104, MW-106, MW-110, and MW-116. Minor populations of bacteria were detected in the three of the four wells, ranging from 0.1 to 13.4 cells/mL. These concentrations are less than the suggested minimum populations that would produce a useful biodegradation rate. Furthermore, TCE and vinyl chloride reductase genes were not detected

in any of the samples. These data suggest that complete biological dechlorination of PCE (to ethene) is unlikely without augmentation.

Samples for analysis of ethene, ethane, and methane were collected from the two excavation 'sumps' during November 2021 and May 2022. Concentrations of methane were substantially higher than the last time these parameters were analyzed in 2014, ranging from 155 to 763 µg/L. The presence of methane indicates methanogenic bacteria activity; however, the dissolved oxygen and oxidation-reduction potential (ORP) values were inconsistent and not indicative of optimal conditions for anaerobic biodegradation.

EnviroForensics obtained approval from the City of Oshkosh to discharge purge water to the sanitary sewer. Approximately 200 gallons of water was discharged to the sewer between July 2021 and May 2022.

PROJECT STATUS

Vapor Intrusion

The vapor intrusion risk to potentially affected structures has been assessed in accordance with WDNR guidance. The assessment results indicate low risk and no need for mitigation. No further assessment of vapor impacts or risk is warranted.

Groundwater Impacts

Groundwater in the Site source area beneath the former building, originally defined by data from MW-101 and TW-9 and currently by Sump South, contains a higher percentage of degradation compounds dichloroethene and vinyl chloride compared to the contamination in the right-of-way, the majority of which is PCE. This finding is consistent with conclusions presented in previous reports and helps to differentiate the Site plume from the 135 High Avenue source. The extent of groundwater impacts that can likely be attributed to the Gunderson Cleaners release alone is depicted in **Figure 6**.

The extent of groundwater contamination in the sewer backfill was apparently defined by grab groundwater samples GP-72 through GP-76, which were collected in 2013, after the remedial action was completed. The locations of these grab samples are described in the highlighted boxes on Figure 7 in **Attachment 1**, and the analytical results are summarized in **Table 5**. They were collected in Market Street south of High Avenue, and in Pearl Street which parallels High Avenue to the south. The contaminants of concern were not detected in any of these samples. It is unclear whether these data were previously reported to the WDNR.

CONCLUSIONS AND RECOMMENDATIONS

EnviroForensics makes the following conclusions based on review of the cumulative investigation, remediation, and monitoring data:

- The site investigation is complete.
- The remedial excavation activities completed in 2012 removed the majority of the unsaturated source material.
- The most likely exposure pathway is vapor intrusion which has been investigated and ruled out by sampling data.
- Remedial action to treat contamination in the High Avenue right-of-way is not realistic from a logistical or cost-benefit perspective. The direct-contact exposure pathway is only possible if excavation occurs, which can be mitigated by institutional controls enacted as part of case closure.

EnviroForensics recommends implementing a remedial action to address residual groundwater contamination on the Site. The objectives of the remedial action would be to reduce potential risk to future occupants and prevent any further migration from the Site (i.e., from the Gunderson Cleaners release) to High Avenue or neighboring properties to the south. Considering the objectives, Site setting, and magnitude of impacts, in-situ treatment via injection of an amendment solution in the vicinity of the soil excavation areas is anticipated.

Proposed next steps:

- Evaluate in-situ remedial technologies and develop a Remedial Action Design Report that details a proposed approach;
- Obtain concurrence/approval from project stakeholders;
- Design and implement the remedial action;
- Conduct limited monitoring to demonstrate effectiveness; and
- Request case closure.

If you have any questions regarding the findings or recommendations presented in this report, please do not hesitate to call us at (262) 290-4001.

Sincerely,
EnviroForensics, LLC

Notes:

Vapor Action and Risk Screeing Levels are calculated according to WDNR Publication RR-800 and subsequent vapor intrusion guidance documents

Results reported in micrograms per cubic meter ($\mu g/m^3$)

Samples analyzed according to EPA Method TO-15

-- = Sample not analyzed for this compound

NE = Screening/action level not established

Bolded values are above detection limits

Bolded and shaded values exceed the applicable screening or action level

TABLE 5

SUMMARY OF POST-REMEDIAL ACTION GRAB GROUNDWATER SAMPLE ANALYTICAL RESULTS

Former Gunderson Cleaners
Oshkosh, Wisconsin

Sample ID		NR 140 PAL	NR 140 ES	GP-72	GP-73	GP-74	GP-75	GP-76/TW-76		
Date				11/11/13	11/11/13	11/11/13	11/11/13	11/11/13	5/21/14	1/4/17
Tetrachloroethene (PCE)	(ug/L)	**0.5**	**5**	<0.47	<0.47	<0.47	<0.47	<0.47	<0.50	<0.50
Trichloroethene (TCE)	(ug/L)	**0.5**	**5**	<0.36	<0.36	<0.36	<0.36	<0.36	<0.33	<0.33
cis-1,2-Dichloroethene	(ug/L)	**7**	**70**	<0.42	<0.42	<0.42	<0.42	<0.42	<0.26	<0.26
trans-1,2-Dichloroethene	(ug/L)	**20**	**100**	<0.37	<0.37	<0.37	<0.37	<0.37	<0.24	<0.26
Vinyl Chloride	(ug/L)	**0.02**	**0.2**	<0.18	<0.18	<0.18	<0.18	<0.18	<0.18	<0.18
Benzene	(ug/L)	**0.5**	**5**	<0.50	<0.50	**79.8**	**24.1**	<0.50	<0.50	<0.50

Notes:

Data collected and reported by Fehr-Graham

NS = No standard established

NA = Not analyzed for parameter

J = Estimated concentration between the laboratory method detection limit and reporting limit

Bolded values indicate the compound was detected

Bolded and blue shaded value indicates an exceedance of the NR 140.10 Preventive Action Limit

Bolded and orange shaded value indicates an exceedance of the NR 140.10 Enforcement Standard

Client Project Name: 200017 Oshkosh Gundersons

Dear Mr. Kappen,

Please find the attached analytical report for the samples received June 28, 2021. All test methods performed were fully compliant with local, state, and federal EPA methods unless otherwise noted. The project was analyzed as requested on the enclosed chain of custody record. Please review the comments section for additional information about your results or Quality Control data.

Feel free to contact me if you have any questions or comments regarding your analytical report or service.

Thank you for your business. EnvisionAir looks forward to working with you on your next project.

Yours Sincerely,

Stanley A Hunnicutt

Dear Mr. Kappen,

Please find the attached analytical report for the samples received June 28, 2021. All test methods performed were fully compliant with local, state, and federal EPA methods unless otherwise noted. The project was analyzed as requested on the enclosed chain of custody record. Please review the comments section for additional information about your results or Quality Control data.

Feel free to contact me if you have any questions or comments regarding your analytical report or service.

Thank you for your business. EnvisionAir looks forward to working with you on your next project.

Yours Sincerely,

Stanley A Hunnicutt

Mr. Brian Kappen
Enviroforensics
N16 W. 23390 Stone Ridge Dr
Suite G
Waukesha, WI 53188

February 7, 2022

EnvisionAir Project Number: 2022-76
Client Project Name: 200017 – Oshkosh Gundersons

Dear Mr. Kappen,

Please find the attached analytical report for the samples received January 28, 2022. All test methods performed were fully compliant with local, state, and federal EPA methods unless otherwise noted. The project was analyzed as requested on the enclosed chain of custody record. Please review the comments section for additional information about your results or Quality Control data.

Feel free to contact me if you have any questions or comments regarding your analytical report or service.

Thank you for your business. EnvisionAir looks forward to working with you on your next project.

Yours Sincerely,

David Norris

EnvisionAir Project Number: 2022-306
Client Project Name: 200017

Dear Mr. Kappen,

Please find the attached analytical report for the samples received May 12, 2022. All test methods performed were fully compliant with local, state, and federal EPA methods unless otherwise noted. The project was analyzed as requested on the enclosed chain of custody record. Please review the comments section for additional information about your results or Quality Control data.

Feel free to contact me if you have any questions or comments regarding your analytical report or service.

Thank you for your business. EnvisionAir looks forward to working with you on your next project.

Yours Sincerely,

David Norris

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.

"J" Flag: Analyte detected between LOD and LOQ LOD Limit of Detection LOQ Limit of Quantitation

Code	*Comment*
1	Laboratory QC within limits.

All solid sample results reported on a dry weight basis unless otherwise indicated. All LOD's and LOQ's are adjusted for dilutions but not dry weight. Subcontracted results are denoted by SUB in the analyst field.
