Technical Assistance, Environmental Liability Clarification or Post-Closure Modification Request

Form 4400-237 (R 12/18)

Page 1 of 6

Notice: Use this form to request a written response (on agency letterhead) from the Department of Natural Resources (DNR) regarding technical assistance, a post-closure change to a site, a specialized agreement or liability clarification for Property with known or suspected environmental contamination. A fee will be required as is authorized by s. 292.55, Wis. Stats., and NR 749, Wis. Adm. Code., unless noted in the instructions below. Personal information collected will be used for administrative purposes and may be provided to requesters to the extent required by Wisconsin's Open Records law [ss. 19.31 - 19.39, Wis. Stats.].

Definitions

- "Property" refers to the subject Property that is perceived to have been or has been impacted by the discharge of hazardous substances.
- "Liability Clarification" refers to a written determination by the Department provided in response to a request made on this form. The response clarifies whether a person is or may become liable for the environmental contamination of a Property, as provided in s. 292.55, Wis. Stats.

"Technical Assistance" refers to the Department's assistance or comments on the planning and implementation of an environmental investigation or environmental cleanup on a Property in response to a request made on this form as provided in s. 292.55, Wis. Stats.

"Post-closure modification" refers to changes to Property boundaries and/or continuing obligations for Properties or sites that received closure letters for which continuing obligations have been applied or where contamination remains. Many, but not all, of these sites are included on the GIS Registry layer of RR Sites Map to provide public notice of residual contamination and continuing obligations.

Select the Correct Form

This from should be used to request the following from the DNR:

- Technical Assistance
- Liability Clarification
- Post-Closure Modifications
- Specialized Agreements (tax cancellation, negotiated agreements, etc.)

Do not use this form if one of the following applies:

- Request for an off-site liability exemption or clarification for Property that has been or is perceived to be contaminated by one
 or more hazardous substances that originated on another Property containing the source of the contamination. Use DNR's Off-Site
 Liability Exemption and Liability Clarification Application Form 4400-201.
- Submittal of an Environmental Assessment for the Lender Liability Exemption, s 292.21, Wis. Stats., if no response or review by DNR is requested. Use the Lender Liability Exemption Environmental Assessment Tracking Form 4400-196.
- Request for an exemption to develop on a historic fill site or licensed landfill. Use DNR's Form 4400-226 or 4400-226A.
- Request for closure for Property where the investigation and cleanup actions are completed. Use DNR's Case Closure GIS Registry Form 4400-202.

All forms, publications and additional information are available on the internet at: <u>dnr.wi.gov/topic/Brownfields/Pubs.html</u>.

Instructions

- 1. Complete sections 1, 2, 6 and 7 for all requests. Be sure to provide adequate and complete information.
- 2. Select the type of assistance requested: Section 3 for technical assistance or post-closure modifications, Section 4 for a written determination or clarification of environmental liabilities; or Section 5 for a specialized agreement.
- 3. Include the fee payment that is listed in Section 3, 4, or 5, unless you are a "Voluntary Party" enrolled in the Voluntary Party Liability Exemption Program **and** the questions in Section 2 direct otherwise. Information on to whom and where to send the fee is found in Section 8 of this form.
- 4. Send the completed request, supporting materials and the fee to the appropriate DNR regional office where the Property is located. See the map on the last page of this form. A paper copy of the signed form and all reports and supporting materials shall be sent with an electronic copy of the form and supporting materials on a compact disk. For electronic document submittal requirements see: <u>http://dnr.wi.gov/files/PDF/pubs/rr/RR690.pdf</u>"

The time required for DNR's determination varies depending on the complexity of the site, and the clarity and completeness of the request and supporting documentation.

Form 4400-237 (R 12/18)

Page 4 of 6

Skip Sections 4 and 5 if the technical assistance you are requesting is listed above and complete Sections 6 and 7 of this form.

Clarification of local governmental unit (LGU) liability exemption at sites with: (select all that apply)

hazardous substances spills - s. 292.11(9)(e), Wis. Stats. [649];

Perceived environmental contamination - [649];

hazardous waste - s. 292.24 (2), Wis. Stats. [649]; and/or

solid waste - s. 292.23 (2), Wis. Stats. [649].

Include a fee of \$700, a summary of the environmental liability clarification being requested, and the following:

(1) clear supporting documentation showing the acquisition method used, and the steps followed under the appropriate state statute(s).

(2) current and proposed ownership status of the Property;

(3) date and means by which the Property was acquired by the LGU, where applicable;

(4) a map and the 1/4, 1/4 section location of the Property;

(5) summary of current uses of the Property;

(6) intended or potential use(s) of the Property;

(7) descriptions of other investigations that have taken place on the Property; and

(8) (for solid waste clarifications) a summary of the license history of the facility.

Clarify the liability associated with a "closed" Property - s. 292.55, Wis. Stats. [682]

Include a fee of \$700.

- Include a copy of any closure documents if a state agency other than DNR approved the closure.

Use this space or attach additional sheets to provide necessary information, explanations or specific questions to be answered by the DNR.

Section 5. Request for a Specialized Agreement

Select the type of agreement needed. Include the appropriate draft agreements and supporting materials. Complete Sections 6 and 7 of this form. More information and model draft agreements are available at: <u>dnr.wi.gov/topic/Brownfields/lgu.html#tabx4</u>.

Tax cancellation agreement - s. 75.105(2)(d), Wis. Stats. [654]

Include a fee of \$700, and the information listed below:

(1) Phase I and II Environmental Site Assessment Reports,

(2) a copy of the Property deed with the correct legal description.

Agreement for assignment of tax foreclosure judgement - s.75.106, Wis. Stats. [666]

Include a fee of \$700, and the information listed below:

(1) Phase I and II Environmental Site Assessment Reports,

(2) a copy of the Property deed with the correct legal description.

Negotiated agreement - Enforceable contract for non-emergency remediation - s. 292.11(7)(d) and (e), Wis. Stats. [630]

Include a fee of \$1400, and the information listed below:

(1) a draft schedule for remediation; and,

(2) the name, mailing address, phone and email for each party to the agreement.

Form 4400-237 (R 12/18)

Page 5 of 6

Section 6. Other Information Submitted
Identify all materials that are included with this request.
Send both a paper copy of the signed form and all reports and supporting materials, and an electronic copy of the form and all reports, including Environmental Site Assessment Reports, and supporting materials on a compact disk.
Include one copy of any document from any state agency files that you want the Department to review as part of this request. The person submitting this request is responsible for contacting other state agencies to obtain appropriate reports or information.
Phase I Environmental Site Assessment Report - Date:
Phase II Environmental Site Assessment Report - Date:
Legal Description of Property (required for all liability requests and specialized agreements)
Map of the Property (required for all liability requests and specialized agreements)
Analytical results of the following sampled media: Select all that apply and include date of collection.
Groundwater Soil Sediment Other medium - Describe:
Date of Collection:
A copy of the closure letter and submittal materials
Draft tax cancellation agreement
Draft agreement for assignment of tax foreclosure judgment
Other report(s) or information - Describe:
For Property with newly identified discharges of hazardous substances only: Has a notification of a discharge of a hazardous substance been sent to the DNR as required by s. NR 706.05(1)(b), Wis. Adm. Code?
─ Yes - Date (if known):
○ No
Note: The Notification for Hazardous Substance Discharge (non-emergency) form is available at: <u>dnr.wi.gov/files/PDF/forms/4400/4400-225.pdf</u> .
Section 7. Certification by the Person who completed this form
I am the person submitting this request (requester)
I prepared this request for: Dave Bieno
Requester Name
I certify that I am familiar with the information submitted on this request, and that the information on and included with this request is true, accurate and complete to the best of my knowledge. I also certify I have the legal authority and the applicant's permission to make this request.

Remedial Action Options Report Portage Cleaners 104 East Wisconsin Street Portage, Wisconsin BRRTS# 02-11-512824

EXECUTIVE SUMMARY

EnviroForensics, LLC. (EnviroForensics) has prepared this Remedial Action Options Report (RAOR) on behalf of David Bieno and Portage Cleaners Inc., for the Portage Cleaners (Portage) facility located at 104 East Wisconsin Street in Portage, Wisconsin (Site). The Site currently operates as a commercial launderer and a drop off location for off-Site dry cleaning.

The Site consists of two (2) parcels that total approximately 0.29 acres with a separate singlestory commercial building on each parcel. The building where former dry-cleaning operations were performed is located on the eastern parcel which occupies approximately 1,884 square feet (ft). The building now operates as a drop off location. The second building, located on the western parcel, conducts commercial laundry services, and occupies approximately 4,250 square ft. The parcel boundaries bisect the location of a previous building which also historically conducted dry cleaning operations as well as coin operated laundry. Both current Site buildings are slab on grade with the remainder of the property covered by paved asphalt driveway and gravel parking area. The location and topography of the Site is depicted on **Figure 1**, and the Site layout is depicted on **Figure 2a** and in more detail on **Figure 2b**.

Environmental impacts were initially detected in soil and groundwater at off-Site, adjacent locations during a Phase II Environmental Site Investigation completed in July 2003 by the Wisconsin Department of Transportation as part of a project related to the Portage Canal. Tetrachloroethene (PCE) and trichloroethene (TCE) were detected in soil at two (2) soil boring locations. PCE and TCE were also detected at one (1) grab-groundwater location.

MSA Professional Services, Inc. (MSA) was retained by Portage Cleaners in October 2003. Between October 2003 and June 2007, nine (9) soil borings were advanced to collect groundwater samples. Subsequently, nine (9) water table wells and two (2) piezometers were installed to monitor groundwater quality. Additionally, four (4) rounds of groundwater sampling were conducted between 2003 and 2007. Investigation activities identified additional soil and groundwater impacts on- and off-Site exceeding Wisconsin Department of Natural Resources (WDNR) screening levels.

Site investigation activities were continued by EnviroForensics between August 2017 and December 2018. The additional site investigation activities included: soil and grab-groundwater sampling, groundwater monitoring, and vapor intrusion assessments to further delineate soil, groundwater and vapor impacts on- and off-Site, respectively. Additionally one (1) groundwater monitoring well (MW-11) was installed downgradient to evaluate the migration and extent.

Further Site investigation activities were performed by EnviroForensics on February 4 - 5, 2019. The ese included: soil sampling to confirm current Site soil conditions and further evaluate source area soil beneath the east building.

Chlorinated volatile organic compounds (CVOCs) were detected in soil at concentrations exceeding the risk-based soil to groundwater and non-industrial residual contaminant levels (RCLs) on- and off-Site. PCE was detected in soil at concentrations exceeding the risk-based industrial RCL beneath the building on-Site. A groundwater plume containing various CVOCs at concentrations above WDNR groundwater enforcement standards (ES) was also established with monitoring wells at locations on- and off-Site.

As exhibited in the soil and groundwater sample results, the area containing the highest CVOC impacts are beneath and adjacent to the Site building on the eastern parcel. Historically, the highest concentrations of CVOCs in groundwater were detected at off-Site well MW-9; however, the most recent groundwater data indicates the highest concentrations of CVOCs are currently at on-Site well MW-4. The elevated concentrations of PCE degradation daughter products observed in Site and downgradient monitoring wells indicate that natural attenuation of PCE is occurring.

Potential exposure pathways consist of direct contact with soil and groundwater, or inhalation of vapors. Direct-contact exposure to soil and groundwater impacts is currently prevented by surface cover materials (i.e. asphalt, concrete, and buildings). As indicated by the results of the vapor intrusion assessments, vapor intrusion does not appear to be occurring on- or off-Site.

Remedial actions were identified through an initial screening of technologies. The actions were evaluated considering technical and economic feasibility for the Site. The recommended option would rely on a combination of risk management strategies and remediation, including soil excavation for the vadose zone, and in-situ chemical reduction injections to treat groundwater, to bring the Site to regulatory closure.

Excavation of the highly contaminated silty sand soil would be completed in two (2) areas, beneath and adjacent to the east building. These excavation areas encompass the majority of the CVOC impacts in the vadose zone, and are considered the source area for continued generation of residual impacts to groundwater. The excavated soil would be hauled off-site for disposal at a permitted facility.

Due to the current status of groundwater concentrations and timing to design a full-scale excavation beneath the Site building, we are recommending an interim remedial action be

performed around the exterior portion of the east building. The interim excavation is readily accessible outside of the east building footprint. The excavation area will encompass the majority of the CVOC impacts in the vadose zone and would be advanced to a minimum of 4 ft below ground surface (bgs). This will ensure that higher CVOC concentrations that have a higher risk of contaminating groundwater are removed and would limit worker exposure during potential future construction at the Site. A remedial action plan will be prepared to address the remaining proposed soil excavation.

The recommended remedial option minimizes Site disruptions, potentially eliminates the need for long-term operation and maintenance of the vapor mitigation systems, and provides the most benefit with respect to overall costs of implementation. The results of periodic groundwater monitoring will be evaluated to determine whether additional actions are needed to achieve remediation goals.

1.0 INTRODUCTION

EnviroForensics, LLC has prepared this Remedial Action Options Report (RAOR) on behalf of David Bieno and Portage Cleaners Inc. for the Portage Cleaners facility located at 104 East Wisconsin Street in Portage, Wisconsin. This Report follows guidelines for selecting remedial actions set forth in the Wisconsin Administrative Code (WAC) Chapter NR 722 and other associated Chapter NR 700 series rules. This Report is being submitted as a result of the additional data found in the Supplemental Data Report dated May 11, 2018.

2.0 BACKGROUND AND HISTORY

2.1 Site and Surrounding Property Information

The Site is located at 104 East Wisconsin Street in Portage, Wisconsin. The location and topography of the Site is depicted on Figure 1. The site consists of two parcels that total approximately 0.29 acres with a separate single-story commercial building on each parcel as depicted on Figure 2a and Figure 2b. The building located on the eastern parcel occupies approximately 1,884 square feet (ft). The eastern building formerly operated as a dry cleaner, but now operates as a drop off location. The second building which is located on the western parcel, houses commercial operations and office space, and occupies approximately 4,250 square ft. The parcel boundaries bisect the location of a previous building, at which dry cleaning operations as well as coin operated laundry operations were historically conducted. Both Site buildings are slab on grade with the remainder of the property covered by paved asphalt driveway and gravel parking area between the two buildings. The Site is bound by the Portage Canal to the north; West Wisconsin Street then commercial buildings to the east; commercial properties to the southwest; Warren Street then commercial buildings to the southeast; and West Mullet Street then a single family residential home to the south. Utilities noted during the Site reconnaissance include water, storm sewer, sanitary sewer, natural gas, telephone, and electrical lines. The general layout of the Site and surrounding area, including salient Site features and utilities, are depicted on Figure 2a and Figure 2b.

2.2 Site History

The Site operated as a dry cleaner from the 1970s to approximately 1996. During that time, PCE was used for dry cleaning operations. The Site consists of two (2) slab-on-grade commercial buildings. A third building was located between the east and west buildings, which historically operated as a dry cleaning facility and a coin operated laundromat until it was destroyed by a fire in 1990. The eastern building formerly operated as a dry cleaner, but now operates as a drop off

location. The west building is utilized as a laundry facility and offices. Dry cleaning machines were located in the north portion of the central building, and two (2) obsolete dry cleaning machines remain on-Site within the east building (labeled "FDCM" and "DCM" on **Figure 2a** and **Figure 2b**).

3.0 CONCEPTUAL SITE MODEL

3.1 Geology and Hydrogeology

The topography at the Site is generally flat. In the surrounding area the land surface slopes gently toward the east. Unconsolidated fluvial sediment overlies bedrock in this portion of central Wisconsin. Cambrian Sandstone is expected to be encountered at 150 to 200 ft below ground surface (bgs). The lithological sequence encountered during environmental investigative activities was generally consistent across the Site. Silty sand, clayey sand, and well graded sand was encountered beneath surficial fill materials from 2 to 40 ft bgs. The Site building is situated approximately 360 ft north of the Wisconsin River and 100 ft south of the Portage Canal.

Groundwater is encountered at depths ranging from approximately 3 to 10 ft bgs at the Site. The direction of shallow groundwater flow is to the northeast. Recharge of groundwater to Site monitoring wells is quick due to the higher hydraulic conductivity of the sandy soil. The shallow groundwater in the unconsolidated sand is unconfined and not used as a resource for domestic applications. Monitoring well construction information is summarized on **Table 1** and groundwater elevations are summarized on **Table 2**. A potentiometric surface map depicting the shallow groundwater flow can be found on **Figure 3**.

As discussed in the Supplemental Data Report dated May 11, 2018, the results of slug testing indicate that the hydraulic conductivity (K) values of shallow saturated soil range from 1.037 x 10^{-3} centimeters per second (cm/sec) in MW-10 to 1.777×10^{-3} cm/sec in MW-4. The mean hydraulic conductivity calculated for tests conducted in MW-4 and MW-10 is 1.444×10^{-3} cm/sec. The results of slug testing indicate that the K values of deeper saturated soil range from 2.580×10^{-2} cm/sec in MW-10P to 4.763×10^{-2} cm/sec in MW-4P. The mean K calculated for tests conducted in MW-4P. The mean K calculated for tests conducted in MW-4P. This would indicate that a more permeable soil type exists below the water table, which is consistent with the lithologic sequence observed at the Site.

The flow velocity (v) for shallow groundwater can be calculated using the above values for hydraulic conductivity and hydraulic gradient as: v = KI/n, where n = effective porosity of the

soil and I = hydraulic gradient. The value n is estimated for this type of soil at 35%. Using the mean K value for water table wells of 1.444×10^{-3} cm/sec, the groundwater flow velocity across the Site is approximately 2.06 x 10^{-4} cm/sec or 213 ft/year.

3.2 Nature and Extent of Impacts

The Site contaminants of concern are the CVOCs PCE and its associated breakdown products.

Soil samples collected from borings GP1A, GP1D, GP2, GW4, GP6 through GP9, MW3 through MW 6, B-1, B-9 through B-21, B-24, and B-28, contained concentrations of PCE and/or breakdown products above the soil to groundwater residual contaminant levels (RCLs). PCE was detected at concentrations exceeding the non-industrial RCL in soil samples collected from borings GP6, MW5, B-9 through B-11, and B-23. Additionally, PCE was detected at concentrations exceeding the industrial RCL in soil samples collected from borings B-25 through B-27.

The lateral extent of PCE detected in unsaturated soil at concentrations exceeding the nonindustrial and industrial RCLs are depicted on **Figure 4** and summarized on **Table 3**. Unsaturated soil samples are samples collected from 0-8 ft bgs. **Figure 4** shows the extent of PCE impacts in shallow soil above the non-industrial and industrial RCLs are limited to within the Site property boundary. The highest concentrations of PCE generally exist in soil beneath the Site building on the eastern parcel. However, PCE was detected in soil at one boring (MW5) to the north west of the eastern Site building at a concentration above the non-industrial RCL. Given the location and concentration of the soil sample, it is anomalous and is possibly due to an unreported and incidental spill. Soil concentrations above the migration to groundwater standard are generally present across the Site.

The lateral extent of CVOC concentrations in groundwater exceeding regulatory standards are depicted on **Figure 5** and grab groundwater and monitoring well analytical results summarized on **Table 4** and **Table 5**, respectively. The extent of PCE and TCE detected at concentrations exceeding their respective ES extend off-site approximately 120 ft to the east. The extension of groundwater impacts off-site is likely due to local shallow groundwater flow which is in the same direction.

The horizontal and vertical distribution of groundwater impacts with depth are depicted on **Figure 6**. The vertical extent of CVOC impacts in groundwater above regulatory standards is generally limited to the depth of water table observation wells which are screened between 3.5-16 ft bgs. Groundwater impacts generally coincide with the distribution of soil impacts, which

appear limited to depths of approximately 15 ft bgs. The vertical migration of PCE impacts appears limited as demonstrated by the low concentrations detected at piezometer MW-10P. It appears that natural attenuation is occurring at depth and distance from the source based on the concentrations and presence of TCE and cis-1,2,-dichloroethene detected in MW-9 and MW-10P.

It should be noted that during the construction of the Columbia County Administration Building located at 112 E. Edgewater St. in Portage Wisconsin, Seymour Environmental Services, Inc. utilized a dewatering system to remove groundwater between March 14, 2016 and April 8, 2016. During the time of operation, the system removed 6,148,600 gallons of groundwater. It is likely that the pumping removed much of the CVOCs in groundwater. **Table 5** shows the concentrations in many of the wells decreased significantly between the samples collected in 2007 and 2017; however, concentrations have rebounded in some of the wells.

The only detection of CVOCs in soil (above non-industrial and industrial RCLs) was PCE. The source of contamination is likely from un-documented and incidental releases of PCE which occurred in the vicinity of the dry cleaning machine and outdoor storage. The sub-surface utility corridor does not appear to have acted as a transport mechanism.

4.0 IDENTIFICATION OF REMEDIAL ACTION OPTIONS

The potentially feasible remedial actions were evaluated according to specific criteria outlined in WAC Chapter NR 722.07, including:

- Technical Feasibility
 - Short-Term Effectiveness,
 - Long-Term Effectiveness,
 - Ability to Implement, and
 - Restoration Time Frame.
- Economic Feasibility
 - Capital Costs,
 - Initial Cost,
 - Annual Operation and Maintenance, and
 - Future Liability.

Additionally, the need for continuing obligations after completion of a remedial action, such as maintenance of an engineering control, was considered. Each of these evaluation criteria are defined and described in the following sections.

4.1 Technical Feasibility

The feasibility of a technology to remediate impacted areas at any specific site is evaluated with regard to the following specific considerations:

- Proven technology: when a technology is fully developed and historical success case histories are available;
- Emerging technology: when a technology is not fully developed and may not be reliable;
- Inappropriate technology: when Site conditions are not technically suitable for the application of the technology; and
- Potential additional liability: whether the treatment technology may add additional liability.

4.1.1 Effectiveness

The key aspect of the technical feasibility evaluation is the effectiveness of each remedial action in protecting human health and the environment. Each potential remedial action is evaluated as to its effectiveness in providing protection and the reductions in toxicity, mobility, or volume of contamination that it would achieve. Both short- and long-term components of effectiveness are evaluated; short-term referring to the construction and implementation period until case closure, and long-term referring to the period after remediation is complete. Reduction of toxicity, mobility, or volume refers to changes in one or more characteristics of the contaminated media using treatment that decreases the inherent risks. Any remedial action option under consideration should minimize adverse impacts to Site workers, visitors, the surrounding population, and the environment.

4.1.2 Ability to Implement

The ability to implement is a measure of both the technical and administrative feasibility of constructing, operating, and maintaining a remedial action option, and is used to evaluate combinations of remedial actions with respect to conditions at a specific site. The determination that an option is not readily implementable would usually preclude it from further consideration unless steps can be taken to change the conditions responsible for the determination.

The technical aspects related to the ability to implement refer to the ability to construct, reliably operate, and meet technology-specific regulations for remedial actions until remediation is complete. It also includes operation, maintenance, replacement, and monitoring of technical components of an action, if required, into the future after the remedial action is complete. The evaluation also considers the ability to obtain approvals and permitting from other offices and agencies, the availability of treatment, storage, and disposal services and capacity, and the requirements for, and availability of, specific equipment and technical specialists.

4.1.3 Restoration Time Frame

Restoration time frame relates to the time required to sever the exposure pathway and complete the remedial action. The estimated time for completion of a remedial action and restoration of the environment is based on the information available from vendor(s) with experience in remediating comparable sites, and EnviroForensics' experience using technologies in similar settings. Contaminant degradation rates, both naturally and under treatment conditions, are assumed based on experience to estimate the duration of remedial actions. For institutional and engineering controls, restoration is complete once the control is effective, however, these controls do not meet the remedial objective and must be paired with other technologies.

4.2 Economic Feasibility

The cost to implement an option represents a combination of typical contractor costs and consultant efforts coupled with the estimated time to achieve remedial endpoints. This is inherent because uncertainties associated with the definition of options often remain, and it may not be possible or practical to collect all the data needed to further refine costs.

The focus is on comparative estimates of costs between options so that if costs go up or down during the remedial process, they remain relative. The following cost factors are considered during the evaluation of options:

- Initial costs: those costs incurred for design and testing of the remedial action;
- Capital costs: the cost to construct, install, or otherwise implement the remedial action;
- Operation and maintenance (O&M) costs: the costs to operate and maintain the remedial system or technology. The evaluation includes those O&M costs that would be incurred for as long as necessary, even after the initial remedial action is complete; and
- Future liability: includes potential additional remedial action costs and costs for property re-development were considered during evaluation to the extent they can be estimated.

4.3 Continuing Obligations

The involvement of continuing obligations in the closure strategy is considered in the evaluation process. Post-closure obligations may include activities such as annual cover inspections and operation, maintenance, and inspection of vapor mitigation systems. These activities may be required for an indefinite period following case closure. A remedial action is considered more advantageous if the resulting need for continuing obligations is limited or eliminated.

4.4 Remedial Action Options Not Selected

An initial evaluation for remedial technologies was completed and the following general response actions were identified as not appropriate based on the above criteria outlined in sections 4.1 through 4.3.

- Unsaturated Zone (0-6 ft)
 - No Remediation;
 - Institutional Controls;
 - Engineering Controls; and
 - In-Situ Remediation by mechanical or chemical means.

These options were rejected due to difficulties in implementation. Space constraints, high soil concentrations, and shallow groundwater will impede the effectiveness of these technologies. Additionally, in-situ chemical treatment would render the area unusable due to instability unless secondary concrete stabilization was implemented.

- Saturated Zone
 - Monitored natural attenuation;
 - Institutional Controls;
 - Engineering Controls;
 - Removal and treatment (pump, treat, and discharge, or pump, treat, and re-infiltrate);
 - Removal and landfill disposal, or removal, ex-situ treatment and disposal; and
 - Contain and treat using a reactive barrier wall.

These options have been rejected due to basic feasibility in a shallow groundwater setting, duration to completion, and the high cost of implementation of the actions. Additionally, the elevated concentrations and minimal PCE daughter products at the Site indicate that natural attenuation is not occurring.

4.5 Remedial Action Options Selected

Since no action is not permitted for this Site, the initial evaluation for remedial technologies identified the following actions as appropriate based on the above criteria outlined in sections 4.1 through 4.4.

- Soil
 - o Excavation and Disposal in a Permitted Facility; and
- Groundwater
 - $\circ \quad \text{In-Situ Remediation} \text{Injection: In-Situ Chemical Reduction}$

These options would rely on a combination of risk management strategies and remediation to bring the Site to regulatory closure. Remedial actions would consist of excavating the heavily contaminated unsaturated soil and injections to treat the near-source groundwater plume. The primary remediation objectives would be to remove source material that would be encountered by construction or utility work and require special management; and contributes to groundwater contaminant concentrations above the ES.

Excavation would be completed in two (2) areas on-Site. The two (2) excavation areas are depicted on **Figure 7**. The first excavation area is outside the east building footprint. The objective is to cost effectively remove higher CVOC concentrations that are accessible and have a higher risk of contaminating groundwater and would limit worker exposure during potential future construction at the Site. Monitoring wells MW3 and MW4, and piezometer MW4P would be abandoned during excavation activities and replaced once the excavation is backfilled. The second excavation area is under the east building. To access the entire extent of contaminated soil, the site building would need to be demolished or significantly modified to access the soils. The excavation would extend to 4-6 ft or the depth to groundwater. However, if the building were to be left in place, the depth of excavation would be limited to shallower depths due to working space restrictions.

These excavation areas encompass the majority of the CVOC impacts in the vadose zone. The excavated soil would be transported off-site for disposal in a permitted facility. Vapor assessments occur after the soil beneath the Site building is excavated to evaluate if a vapor mitigation system would be necessary.

Groundwater sampling events would be performed after the excavations have been completed and prior to any injections. The additional groundwater data collected would provide current

groundwater conditions and evaluate the effectiveness of the excavations in reducing the mass loading of CVOCs to groundwater. It would also aid in designing a full-scale injection.

In general, groundwater remediation would include zero-valent iron (ZVI) injections to treat the near-source groundwater plume. For the purpose of this document, "ZVI" is used in lieu of a specific product. The product selected will utilize the ZVI in-situ chemical reduction (ISCR) technology most likely in combination with enhanced reductive de-chlorination (ERD).

It is anticipated that inclusion on the WDNR Geographic Information Systems Registry will be necessary for residual groundwater contamination at downgradient locations.

5.0 INJECTION PILOT TESTING

In-situ remediation of groundwater impacts at and near the source area is the most practicable and cost-effective approach once source treatment is complete. Specifically, injection of a reducing amendment would be an appropriate treatment for the concentrations and depths of contamination present at the Site. However, any in-situ remedial approach should be tested prior to full-scale application. The objectives of the testing would be to:

- Evaluate the feasibility of subsurface injection; and
- Collect data to design a full-scale source area treatment.

The ZVI injections would target groundwater below the Site property. A remedial design characterization phase would be prepared conduct the pilot test injection. This step would allow an appropriate full-scale injection design to be developed, including injection point spacing and product volumes required to treat each interval.

6.0 INTERIM ACTION

The remedial option described in section 4.5 identifies two (2) areas that contain elevated concentrations of PCE in soil. Current groundwater concentrations are low compared to past events. This is likely due to the dewatering system that operated between March 14, 2016 and April 8, 2016. The primary objective of an interim excavation is to remove highly contaminated material that continually supports dissolved phase impacts to reduce groundwater concentrations. The area near outside the east building is currently accessible and the direct contact to the contaminated soil is currently only prevented by surface cover materials (i.e. gravel and asphalt).

Given the straightforward nature of the exterior excavation and removal action, the time develop and design a plan to address the impacts below the building footprint would slow down the time frame to address impacts readily accessible exterior soils. The interim activities are described in the following sections.

6.1 Interim Remedial Excavation

The interim remedial excavation would take place outside the east building footprint. The excavation area will encompass the majority of the CVOC impacts in the vadose zone and would be advanced to a minimum of 4 ft bgs. This will ensure that higher CVOC concentrations that have a higher risk of contaminating groundwater are removed and would limit worker exposure during potential future construction at the Site. The extent of the interim excavation is depicted on **Figure 7**.

The soil will be excavated by mechanical methods and transported off-site for disposal at a permitted facility. Approximately 512 tons of non-hazardous soil will be removed. Excavated non-hazardous soil will be loaded and transported for disposal at Madison Prairie Landfill in Sun Prairie, Wisconsin.

Confirmation samples will be collected from the excavation. Approximately 10 samples will be collected from sidewalls, and three (3) samples will be collected from the floor of the excavation. Soil samples will be transmitted to a state-certified laboratory and analyzed for CVOCs according to U.S. EPA SW-846 Method 8260.

The excavation will be backfilled with clean compactable fill and topped with an asphalt cap. Monitoring wells MW3 and MW4, and piezometer MW4P will be replaced with permanent wells to assess groundwater conditions post excavation.

6.2 Monitoring Well Installation, Development, and Sampling

After excavation activities are completed, two (2) water table monitoring wells MW3 and MW4 (to be renamed MW3R and MW4R, respectively), and one (1) piezometer (MW4PR) will be reinstalled. The wells will be installed in accordance with the requirements of WAC Chapter NR 141. Well materials will consist of 2-inch diameter PVC. At the surface, the wells will be completed with a flush-mounted vaults. Expandable locking caps and keyed alike locks will be placed on each well. The new monitoring wells will be developed according to the procedures described in WAC Chapter NR 141. Monitoring well construction and development information

will be recorded on WDNR Forms 4400-133A/B and submitted with subsequent Remedial Action reporting.

7.0 CONCLUSIONS AND RECOMMENDATIONS

After the evaluation of the concentrations and depths of contamination present in soil and groundwater at the Site, soil excavation and injection of a reducing amendment are appropriate remedial strategies for soil and groundwater, respectively. This recommendation is the best option with respect to technical and economic feasibility, and assurance of contaminant removal and destruction. The long-term liability will be reduced significantly by removing the soil source and is expected to provide more certainty regarding the timeframe to reach remedial endpoints. Long-term monitoring requirements will also be significantly reduced with an aggressive source reduction approach.

Groundwater monitoring will be performed post excavation activities to establish revised baseline concentrations prior to evaluating the need for subsequent injections. Should injections be required to address the groundwater contamination, an injection pilot test is highly recommended prior to any full-scale implementation. This step would allow an appropriate fullscale injection design to be developed, including injection point spacing and product volumes required to treat each interval, and proposed activities would be proposed under separate cover.

Due to the current status of groundwater concentrations and timing to design a full-scale excavation beneath the Site building, we are recommending an interim remedial action be performed around the exterior portion of the east building. The interim excavation is readily accessible and would remove highly contaminated material that continually feeds dissolved phase impacts and reduce groundwater concentrations on-site to prevent ongoing off-Site migration. A remedial action plan will be prepared to address the remaining proposed soil excavation.

Notes:

Updated with WDNR's March 2017 Remediation Redevelopment Program RCL spreadsheet

All concentrations reported in units of micrograms per kilogram (µg/kg)

Samples analyzed using EPA SW-846 Method 8260

Bolded values are above detection limits

Bolded and Shaded blue values exceed the WDNR generic Soil to Groundwater Residual Contaminant Levels

Bolded and Shaded green values exceed the WDNR generic Non-Industrial Residual Contaminant Levels

Bolded and Shaded orange values exceed the WDNR generic Industrial Residual Contaminant Levels

Gray Shaded value indicates soil collected below water table

VOCs = Volatile Organic Compounds

J = Concentration is less than the reporting limit but greater than the method detection limit.

NA - Not Analyzed

Notes:

 $\mu g/L = micrograms \ per \ liter$

Samples analyzed using EPA SW-846 Method 8260

VOCs = Volatile Organic Compounds

Bolded and orange shaded values are above Public Health Enforcement Standard

Bolded and blue shaded values are above Public Health Preventive Action Limit

Bolded values are above detection limits

Samples/constiuents not shown are below laboratory reporting limits

J = Analyte concentration detected between the laboratory Reporting Limit and the laboratory Method Detection Limit

Notes:

 $\mu g/L = micrograms per liter$

Samples analyzed using EPA SW-846 Method 8260

VOCs = Volatile Organic Compounds

Bolded and orange shaded values are above Public Health Enforcement Standard

Bolded and blue shaded values are above Public Health Preventive Action Limit

Bolded values are above detection limits

Samples/constiuents not shown are below laboratory reporting limits

J = Analyte concentration detected between the laboratory Reporting Limit and the

laboratory Method Detection Limit

NE = Not Established

NLRA = No laboratory results availble
