Reference: Waste Characterization – Former Heat Treating Pit
1512 Washington Street
Manitowoc, Wisconsin
USEPA Cooperative Agreement No. BF-00E01529-0
Stantec Project No. 193703931

Dear Mr. Sparacio:

As a continuance of the September 2016 site-specific sampling and analysis plan for waste characterization, Stantec sampled residual water contained in the brick-lined heat treating pit and sludge in the doorway between the heat treating pit and the subsurface service tunnel network at the former industrial buildings located at 1512 Washington Street, Manitowoc, Wisconsin (herein referred to as the Site). The work described in this letter report was performed using funds from an assessment grant for hazardous substance brownfields awarded to the City by the United States Environmental Protection Agency (USEPA) in 2015 under cooperative agreement BF-00E01529-0.

BACKGROUND AND PURPOSE

As suggested by others in several prior investigations, the former heat treating area located in the southeast corner of the South building (Figure 1) was previously utilized during industrial operations to heat treat metal using a petroleum-based process. As noted previously by Stantec, most the mechanical and electrical components associated with the former heat treating system have been removed/deconstructed. The remaining components primarily consist of remaining kettles and a shallow below-grade brick-lined pit containing residual water and plastic drums/debris (Attachment A, Photo 1-2). Previous reports prepared by others speculated the white plastic drums currently located in the pit may have been used to store electrical transformer oil and therefore could have contain residual polychlorinated biphenyls (PCBs). Therefore, the primary purpose of this sampling is to characterize the remaining water in the pit for removal/disposal purposes to prepare the area for demolition. Secondarily, water quality results will be used to evaluate the heat treating pit as a possible PCB release area.

As noted previously by Stantec, the heat treating pit connects to the subsurface tunnel network through a small doorway (Appendix A, Photo No. 3). While collecting the water sample from the pit, Stantec noted the presence of sludge with an apparent petroleum impact in the tunnel adjacent to the heat treating pit (Attachment A, Photo Nos. 4-6). Stantec sampled the sludge to characterize the material for removal/disposal purposes and to further evaluate the area as a possible PCB release area.

METHODS

Stantec collected samples of the water in the heat treating pit and samples of the sludge in the tunnel on December 9, 2016. Water samples were collected directly into laboratory-supplied sample containers per Stantec Standard Operating Procedure (SOP-05) and were not field-

January 3, 2017
Mr. Nicolas Sparacio

Reference: Waste Characterization – Former Heat Treating

filtered. Sludge samples were collected directly into laboratory-supplied sample containers per Stantec SOP-02. Samples were placed in coolers on ice and submitted to TestAmerica Laboratories, Inc. (Chicago, Illinois) under chain of custody procedures per Stantec SOP-07 for extraction and analysis per the Stantec (2015) Quality Assurance Project Plan and associated addenda. The laboratory report is provided in Attachment B.

RESULTS

Heat Treating Pit Water. Samples of the water in the heat treating pit were analyzed for PCBs (Method 8082A) and Resource Conservation and Recovery Act (RCRA) metals (6010C/7470A) following Toxicity Characteristic Leaching Procedure (TCLP) extraction. As noted in the laboratory report, the concentrations of the target 7 PCB Aroclors were all less than the detection limit of 0.18 micrograms per liter, including Aroclor 1260, which is the PCB mixture associated with two former electrical transformers at the Site. Therefore, water quality data suggests the heat treating pit is not likely a PCB release area. The concentrations of heavy metals following TCLP extraction were all less than laboratory reporting limits and less than respective TCLP standards indicating the water is not considered characteristically hazardous for the constituents analyzed per 40 CFR 261.24. Of additional note, the concentration of lead in the water sample following TCLP extraction was slightly greater than the method detection limit of 0.0075 milligrams per liter, but less than the laboratory reporting limit of 0.05 milligrams per liter.

Sludge. Samples of the sludge were analyzed for PCBs (Method 8082A), volatile organic compounds (VOCs; 8260B), and polycyclic aromatic hydrocarbons (PAHs; Method 8270D). As noted in the laboratory report, the concentrations VOCs and the target 7 PCB Aroclors in the sludge were all less than laboratory detection limits, including Aroclor 1260, which is the PCB mixture associated with two former electrical transformers at the Site. Therefore, sludge data further suggests the heat treating pit is not likely a PCB release area. The concentrations of 5 PAHs in the sludge that were greater than the laboratory detection limits are summarized below:

PAH Compound	Concentration (milligrams per kilogram)
Chrysene	15.0
Fluoranthene	2.9J
Fluorene	2.6J
Phenanthrene	19.0
Pyrene	13.0

"J" = concentration is greater than the method detection limit, but less than the laboratory reporting limit and is therefore an estimated value.

CONCLUSIONS

Stantec recommends pumping the water from the heat treating pit and removal of the sludge from the tunnel prior to building demolition. The removed water and sludge should be managed appropriately and disposed of offsite at an approved facility.

LIMITATIONS

Stantec's observations, findings, and opinions should not be considered as scientific certainties, but only as opinion based on our professional judgment concerning the significance of the data gathered during the course of this investigation. Specifically, Stantec cannot represent that the Site does not contain any hazardous or toxic materials/wastes or other latent conditions beyond that observed by Stantec during the course of the investigation. Additionally, due to limitations of this investigation process and the necessary use of data furnished by others, Stantec and its subcontractors cannot assume liability if actual conditions differ from the information presented in this report.

No additional comments.

Receipt

The samples were received on 12/10/2016 10:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.5° C.

GC/MS VOA

Method(s) 5035: extract vial has < 8 grams of sample in 10 ml of methanol. Mirro Building Heat Treat Pit Sludge (500-121318-2)

Method(s) 8260B: The laboratory control sample (LCS) for 365158 recovered outside control limits for the following analytes: 1,2,3-Trichlorobenzene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: The extraction LCS associated with preparation batch 364575 had several analyte recoveries above control limits. The data have been reported and qualified.

Mirro Building Heat Treat Pit Sludge (500-121318-2)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA

Method(s) 8270D: The following sample was diluted due to the nature of the sample matrix (large hydrocarbon background): Mirro Building Heat Treat Pit Sludge (500-121318-2). Elevated reporting limits (RLs) are provided.

Method(s) 8270D: The following sample required a dilution due to the nature of the sample matrix: Mirro Building Heat Treat Pit Sludge (500-121318-2). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA

Method(s) 8082A: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 500-364595 recovered outside control limits for the following analytes: PCB-1016 and PCB-1260; however, %R was within control limits for both the LCS and LCSD. Data has been qualified and reported.

Method(s) 8082A: The following samples required a mercury clean-up, via EPA Method 3660A, to reduce matrix interferences caused by sulfur: Mirro Building Heat Treat Pit Sludge (500-121318-2). The reagent lot number used was: 153166.

Method(s) 8082A: The following sample was diluted due to the nature of the sample matrix: Mirro Building Heat Treat Pit Sludge (500-121318-2). Elevated reporting limits (RLs) are provided.

Method(s) 8082A: The following sample required a dilution due to the nature of the sample matrix: Mirro Building Heat Treat Pit Sludge (500-121318-2). Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method(s) 6010C: The low level check standard recovery associated with batch 500-365148 at line 8 was above the control limits for Selenium. The associated sample is a non-detect (ND) for Selenium, therefore the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.

GC/MS Semi VOA

Qualifier	Qualifier Description
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*	RPD of the LCS and LCSD exceeds the control limits
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
