Subject: Interim Remedial Action Design Report: Klinke Cleaners, Sherman Avenue  
May 3, 2019  
BRRTs: 02-13-551965

Dear Mr. Klinke:

The Department has reviewed the EnviroForensics source area characterization report and the contaminated soil excavation plan for the Sherman Avenue site. It appears the source area characterization work has, for the purposes of an interim remedial measure, adequately defined the onsite soil contamination. In addition, the Department agrees and approves of the proposed soil remedial approach. The excavation work can be completed as planned.

After excavation completion the Department will require additional groundwater monitoring to evaluate the impact of the remedial effort. It is anticipated the source removal will create groundwater quality improvement in area defined by well nests MW-1, MW-2 and MW-3. Quarterly to semiannual follow-up monitoring for 12-18 months should be enough to determine if groundwater quality is improving. If it is determined that improvement is not occurring additional remedial measures may be necessary.

This completes the Department's review. If you have any questions or comments about this review, please contact me directly.

Sincerely

R. Michael Schmoller  
Hydrogeologist
