Mr. Jeremy Mitchell  
Senior Hydrogeologist/Project Manager  
Remediation and Redevelopment Program  
Wisconsin Department of Natural Resources  
2984 Shawano Avenue, Green Bay, WI 54313

**Subject: Additional Site Investigation Results for the former FV Steel and Wire Company Site at 111 North Douglas Street, Hortonville, Outagamie County, Wisconsin — BRRTS No. 02-45-560221. AECOM Project No. 60428891**

Dear Mr. Mitchell,

AECOM Technical Services, Inc. (AECOM) is pleased to submit this Site Investigation (SI) report for the FV Steel and Wire Company who formerly owned the site at 111 North Douglas Street, Hortonville, Outagamie County, Wisconsin. This site investigation was undertaken to further assess deeper VOC concentrations at the source area and PAH impacts along Douglas Street at the subject property.

The recent site investigation activities represent a portion of the agreed upon scope of work in the current work plan submitted by AECOM on March 1, 2017, with supplemental information being submitted on July 17, 2017. Since access has not been able to be obtained for the off-site proposed piezometer location, a portion of the work was completed (including the installation of the source area piezometers) to obtain new groundwater information that will allow for improved decision making on future site investigation and management strategies. A discussion of the new subsurface data collected in 2020 and a new proposed location for PZ-7 is included in this report.

If you have any questions regarding the attached document, please contact us.

Respectfully,

AECOM Technical Services, Inc.

Gary Braun, PG (IL)  
Senior Hydrogeologist/Project Manager

Andrew Mott, PG (WI), CPG

### Hydrogeologist Certification

I, Andrew G. Mott, hereby certify that I am a hydrogeologist as that term is defined in s. NR 712.03 (1), Wis. Adm. Code, am registered in accordance with the requirements of ch. GHSS 3, Wis. Adm. Code, and that, to the best of my knowledge, all of the information contained in this document is correct and the document was prepared in compliance with all applicable requirements in chs. NR 700 to 726, Wis. Adm. Code.

## 1.0 Introduction

This report has been prepared by AECOM Technical Services (AECOM) on behalf of FV Steel and Wire Company (FVSW) to document site investigation activities conducted in October and November 2020 at the 6.64-acre industrial property formerly owned by FVSW located at 111 North Douglas Street (Parcel Number 240031100) in Hortonville, Wisconsin. The recent site investigation activities represent a portion of the agreed upon scope of work in the current work plan. The current work plan was submitted to Wisconsin Department of Natural Resources (WI DNR) by AECOM on March 1, 2017 (AECOM, 2017a), with supplemental information being submitted on July 17, 2017 (AECOM, 2017b) at the request of WI DNR reviewers.

The primary work scope included in the Work Plan was further investigation of the Glacial Outwash hydrostratigraphic unit. Vertical profiling near the source area and evaluation of the horizontal extents of volatile organic compound (VOC) concentrations in the Glacial Outwash were proposed to characterize these concentrations in groundwater. The March 1, 2017 work plan (AECOM, 2017a) included installation of four roto-sonic drilled bedrock-contact piezometers (PZ-4, PZ-5, PZ-6, and PZ-7) to supplement the three existing piezometers. The scope of work also included: 1) abandonment of the 6-inch diameter “well” casing that was found along the north property boundary, 2) two rounds of groundwater quality monitoring, 3) hand auger soil sampling in the ditch-line near MW-13, and 4) an assessment of aquifer hydraulic conductivities.

The July 17, 2017 supplemental investigation plan (AECOM, 2017b) added the installation of a multi-level piezometer near the “source” area adjacent to shallow monitoring well MW-1. It also included shifting the proposed location of offsite piezometer PZ-7 to be closer to historical offsite tank spills in the adjacent property former owned by the American Toy Company. However, implementation of the existing site investigation plans (AECOM, 2017a and AECOM, 2017b) have been delayed for three years due to stalled access negotiations for installation of proposed off-site piezometer PZ-7.

To avoid further delays, a portion of the site investigation – including the installation of the source area piezometers – was advanced to obtain new groundwater information that will allow for improved decision making on future site investigation and management strategies. Specifically, the new subsurface investigation will be used to reevaluate the location and need for PZ-7 relative to achieving site closure. A discussion of the new subsurface data collected in 2020 and a new proposed location for PZ-7 is included in this report.

### 1.1 Site Description

The subject property, which is 6.64 acres in size and is zoned industrial, is located at 111 N. Douglas Street in the Village of Hortonville (Figure 1). The parcel is present within the Northwest 1/4 of the Southwest 1/4 of Section 35 Township- 22 North Range 15 East of Outagamie County. Approximate coordinates (in Wisconsin Transverse Mercator, meters) are 627452 (X) and 430245 (Y). Ground surface elevations vary from approximately 815 feet above the North American Datum of 1988 (Ft MSL) along the southern property line shared with the Chicago and Northwestern Railroad tracks to 800 Ft MSL towards the residential parcels north-northeast of the property.

The subject property is currently occupied primarily by a single-story building approximately 73,200 square feet (ft<sup>2</sup>) in dimension. The structure is constructed of a structural steel frame with masonry block and concrete floors. A wood-framed out building, which is about 3,500 ft<sup>2</sup> in size, is located immediately west of the main site structure. Finally, a small garage (900 ft<sup>2</sup>) is located east of the

main site structure. The remainder of the surface is covered with asphaltic concrete, concrete, gravel, and landscaped areas as illustrated in Figure 2. South and west of the aforementioned railroad tracks is an industrial parcel that was formerly owned by the American Toy Company.

## 1.2 Site Background

The subject property was used for agricultural and rural residential purposes until development in 1948 as a manufacturing facility for various steel and wire products under the name Wire Products Company (Phase I ESA report by Clayton Group Service, 2005). The company changed its name to Fox Valley Steel and Wire Company in 1995. In 2001, the company (except for the subject property) was sold to Monroe Acquisition Corporation, who leased the property and continued to operate steel and wire products manufacturing operations at the subject property under the name "Fox Valley Steel & Wire" until 2014. The original Fox Valley Steel and Wire Company retained ownership of the subject property and in 2001 changed its name to FV Steel and Wire Company. The current owner of the subject property is "111 N. Douglas, LLC" who took ownership as of March 5, 2018.

AECOM's previous subsurface investigation report (AECOM, 2016) summarized the historical environmental investigations at the property, as follows:

Between 2009 and 2013 United Engineering Consultants (United) on behalf of the tenant, Fox Valley Steel & Wire, conducted a site investigation of the property under BRRTS Case No. 02-45-553699. The site investigation was prompted by a June 5, 2009, letter from WDNR indicating that "visible disposal of uncontained sludge" was noted. During United's site investigation between 2009 and 2013, approximately 50 direct push borings were advanced with soil and water analysis. In addition, 13 groundwater monitoring wells were installed and sampled 3 to 4 times along with an on-site production well located along the south edge of the subject property near the wood structure.

Concentrations of selected VOCs including trichloroethene (TCE) exceeded Wisconsin Administrative Code (WAC) chapter NR 140 enforcement standards (ES) and/or preventive action limits (PALs) in some of the monitoring wells along with the on-site former supply well. In correspondence between United and WDNR it was suggested that VOC and polynuclear aromatic hydrocarbons (PAH) impacts in soils and groundwater were the responsibility of FV Steel and Wire Company. The WDNR issued an April 10, 2013, responsible party (RP) letter to Keystone Consolidated, Inc., requiring implementation of further soil and groundwater investigation for VOCs and PAHs along with a possible VOC vapor analysis under BRRTS case number 02-45-560221.<sup>1</sup> In a July 18, 2013, Phase II assessment report, United on behalf of the tenant, Fox Valley Steel & Wire, requested closure of the project case for inorganics, including metals and cyanide. WDNR issued final closure for metals under BRRTS case number 02-45-553699 on March 6, 2014.

Readily available records also indicated that up to four underground storage tanks (USTs) may have been on-site over the course of site operations. Three reported USTs included a 10,000-gallon diesel UST, a 7,000-gallon fuel oil UST, and a 550-gallon unleaded gasoline UST that were subsequently

---

<sup>1</sup> FVSW is a wholly-owned subsidiary of Keystone Consolidated, Inc.

removed in 1989. An additional 550-gallon UST is suspected to be double reported in the Wisconsin UST database.

The former American Toy & Furniture Company property (now owned by Affordable Rental & Storage, LLC) located south of the subject property conducted soil and groundwater investigation related to tetrachloroethylene (PCE) and TCE impacts to soil and groundwater from a spill under BRRTs Numbers 02-45-00563 (closed ERP) and 06-45-307856 (open VPLE). Surface soil and dissolved impacts at the area of the spill in the water table aquifer were delineated on-site and are currently in VPLE long-term monitoring for natural attenuation. No information was obtained regarding investigation of other areas of the site or the deep unconsolidated aquifer beneath the property.

### 1.3 Report Organization

The remaining portion of Section 1 provides contact information of the participants of this investigation. The remainder of the report describes the Methods (Section 2.0), Results (Section 3.0), and Conclusions (Section 4.0) related to additional site investigation activities conducted in October and November 2020.

### 1.4 Investigation Participants

The following parties are participants in this site investigation.

<p><b>Responsible Party:</b> FV Steel and Wire Company (FVSW) 288 Argentina Avenue Bartonville, IL 61607</p>	<p><b>Contact:</b> Mr. Chad Erdmann Environmental Manager Chad.Erdmann@libertysteel.us (309) 697-7165</p>

<p><b>Former Tenant and Plant Operator (2001-2014):</b> Fox Valley Steel &amp; Wire</p>	<p><b>Contact:</b> Mr. James Monroe</p>

## 2.0 Investigative Methods

The recently completed subsurface investigation was focused around the installation of a nested piezometer installed near the “source area” where the highest concentrations of chlorinated solvents were previously observed. The nested piezometers were installed using roto-sonic techniques that were performed in accordance with WAC NR 141. The deep soil boring for PZ-MW1C was advanced at the source area and yielded continuous subsurface retrieval for stratigraphic review. Retrieved soil samples were visually inspected and logged on-site by an AECOM geologist using the Unified Soil Classification System (USCS). Borings advanced for the two shallower piezometers (PZ-MW1A and PZ-MW1B) within the nested well were not sampled (blank drilled) since they were offset less than 10 feet from PZ-MW1C. Shallow well MW-14 was advanced in a similar fashion. The boring logs for the new piezometers and monitoring well are included in Appendix A1.

The new monitoring well and piezometers were constructed of 2-inch diameter schedule 40 PVC with a 5-foot slotted screen (0.010-inch manufactured slots). Three nested piezometers were installed as indicated in the Work Plan Addendum (AECOM, 2017b), but the well screen intervals for PZ-MW1A and PZ-MW1B were adjusted to accommodate coarser-grained sand deposits for better groundwater yields within the Outwash Unit as summarized below (listed as feet below ground surface, ft bgs):

- PZ-MW1A (40 to 45 ft bgs)
- PZ-MW1B (55 to 60 ft bgs)

The screen interval for PZ-MW1C (75 to 80 ft bgs) was installed at the inferred unconsolidated-sandstone bedrock contact. AECOM surveyed the elevations of MW-14 and the piezometers following installation. Details of well construction are provided on the well construction reports provided in Appendix A2.

After the well seals were allowed to hydrate, each new groundwater monitoring point was developed using surge and purge techniques. The wells were surged using a nominal 2-inch diameter surge block and then purged using a disposable bailer or a submersible pump. Purging continued until at least 10 well volumes were excavated from the wells, which resulted in minimum turbidity (visually clear) being achieved. Note that monitoring well MW-14 was dry after its installation and not developed. Well development records are included in Appendix A3.

Groundwater level monitoring and sample collections were conducted at the new nested piezometers (PZ-MW1A, PZ-MW1B, and PZ-MW1C), new upgradient monitoring well (MW-14), as well as existing monitoring wells and piezometers that were located. Two monitoring wells (MW-2 and MW-9) and one piezometer (PZ-1) could not be located and suspected to be covered with gravel from snow plowing or lot grading activities. Static groundwater levels were recorded using an electronic water level tape to an accuracy of 0.01 feet below the top of the PVC riser pipes. A summary of the groundwater level monitoring results is provided in Table 1.

Groundwater samples were collected using minimum drawdown (low-flow) sampling techniques. Similar to previous sampling events, water samples were collected from water table wells using a peristaltic pump and from piezometers using a submersible pump. Dedicated tubing was used for the sampling in all wells. A flow-through cell was used during well purging so the field parameters, including: temperature, pH, and specific conductance could be recorded, and consistent readings could be reasonably assured that indicate formation water is being sampled rather than static water

within the riser pipe. Groundwater samples were analyzed for VOCs (using EPA Method 8260), as well as several natural attenuation parameters, including: methane, ethane, ethene, nitrate/nitrite, chloride, and sulfide. Analytical testing was performed by Pace Analytical Services, Inc. (Pace) of Green Bay, Wisconsin.

Soil cuttings and well purge water were drummed, tested, removed from the site, and disposed of by a licensed waste hauler, Covanta Environmental Solutions, from Winneconne, Wisconsin. Copies of the disposal records are included in Appendix A4.

### **Soil Sampling**

Four soil samples were collected after hand augers were advanced to a depth of approximately 3 ft bgs along the ditch line near monitoring well MW-13. Utilities were cleared by a subcontracted utility locating service and from the Hortonville Public Works Director. The soil samples were collected from the hand auger borings to aid in further delineation of PAH soil impacts along the ditch-line.

## 3.0 Results

### 3.1 Site Geology

The shallow subsurface materials consist of fill, recent silt and fine-sand flood deposits, and Pleistocene sub- and pro- glacial meltwater deposits. These overburden materials are underlain by undifferentiated Upper Cambrian sandstones from the Franconia and Dresbach member sandstones of the Trempealeau Formation, as illustrated in the North-South regional geologic cross-section included as Figure 3. Glacially-derived Pleistocene materials consist of mostly glacial drift overlying bedrock, which are in turn overlain by till and glacial-fluvial and fill deposits. Overburden deposits range from 50 to 79 feet in thickness, as observed in the borings for PZ-1, PZ-2, PZ-3, and PZ-MW1C. Sandstone bedrock was observed at the terminal depths for each of these four borings.

Specifically, the upper five to seven feet of soil typically consists of fine to medium-grained sand topped with various reworked fill material. Underlying the surficial sand (and fill) deposits is fine-grained silty-clay till unit that is yellowish-brown to dark brown, damp to moist with trace volumes of fine to coarse gravel. The Quaternary Till Unit varies from 6 to 14 feet in thickness and generally observed between elevations 795 and 805 Ft NAVD88. The water table is shallow (approximate 5 ft bgs) and observed either within the base of the surficial sand deposits or within the upper portion of the till unit.

An outwash unit underlies the glacial till and was observed to extend to bedrock at depths from 51 to 79 ft bgs, or elevations that vary from 736 to 759 Ft NAVD88. Outwash primarily consists of silty sand (SM), but was typically found to be coarser grained (poorly to well sorted medium sand) for 5 to 10 feet immediately overlying bedrock. The outwash appears to be only slightly coarser-grained than the primarily silty clay of the till unit that overlies it.

Silty clay (CL) and well sorted sand (SW) were occasionally observed as 2 to 4-foot thick lens within the outwash. However, the lenses were not observed to be consistent across the site at piezometer locations. Bedrock elevations appear to vary considerably across the site, considering the bedrock elevation at PZ-1 is more than 20 feet higher (759 Ft) than observed at the remaining site piezometers (about 736 Ft MSL at PZ-2, PZ-3, and PZ-MW1C). Additional bedrock elevations were inferred from local well records to assess the bedrock surface and its potential for structural controls on groundwater flow. A structural contour map of the bedrock surface is included as Figure 4. The inferred local bedrock surface indicates bedrock elevations range locally from more than 800 Ft MSL less than a half-mile west to less than 650 Ft MSL north of the subject property. Bedrock lows correspond to the buried bedrock valley that underlies the Wolf River Basin.

### 3.2 Site Hydrogeology

A contour map of the water table was developed (Figure 5) based on the static groundwater elevations measured at shallow monitoring wells on November 11, 2020. A summary of the groundwater elevations, along with a comparison to water levels measured in March 2016 are summarized in Table 1. Groundwater flow is generally north or northeast as illustrated on Figure 5. The measured water table was encountered at a depth of approximately 2 to 8 ft bgs in the shallow monitoring wells.

Shallow groundwater flows generally north/northeast toward the Wolf River Basin. The Wolf River is the major regional groundwater sink and runs east-west approximately one-mile north of the site. Its present location overlies a bedrock valley which is filled with glacial deposits that are may be up to 800 feet in thickness (LeRoux, E.F., 1957). The glacial and recent deposits from the Wolf River produce a broad, low-lying river bottoms area. The subject property is located in a transition area between the higher topography to the south and the Wolf River valley located approximately one-mile to the north. The average horizontal hydraulic gradient of the water table in the Till Unit is approximately 0.017 ft/ft across the site indicated on Table 2.

Equilibrated piezometric elevations observed in the piezometers completed within the Outwash indicate a primarily southerly flow direction as shown on Figure 6. The horizontal hydraulic gradient as the base of the Outwash unit was an order of magnitude lower than the Till unit. The horizontal hydraulic gradient calculated at the basal outwash/bedrock interface was 0.00167 ft/ft as summarized on Table 2. The resulting depth to water in the piezometers was approximately 7 to 14 ft bgs, which indicates confined (or leaky confined) conditions within Outwash Unit. Field hydraulic conductivity tests will provide additional information on hydraulic properties of the Till and Outwash units. The hydraulic conductivity tests have been delayed until the remaining proposed piezometers are installed. The hydraulic conductivity of the bedrock is better understood considering the Upper Cambrian series sandstones yield sufficient volumes of groundwater, and therefore are the primary source of water for industrial and public-supply wells in Outagamie County (LeRoux, 1957). Regardless, hydraulic testing and additional groundwater level monitoring will occur in 2021 to further evaluate aquifer properties, groundwater flow directions and fluctuation of seasonal water table and piezometric levels.

### 3.3 Groundwater Conditions

The results of the chemical analyses conducted on 17 water samples collected from the following monitoring points are summarized in Appendix B-1:

Water Table Monitoring Wells		Outwash / Bedrock Interface Piezometers
MW-1	MW-8	PZ-MW1A
MW-3	MW-10	PZ-MW1B
MW-4	MW-11	PZ-MW1C
MW-5	MW-12	PZ-2
MW-6	MW-13	PZ-3
MW-7	MW-14	

Detections of VOCs were observed in the water table monitoring wells, but concentrations were low or not detected. Only four potential ES exceedances were observed in shallow monitoring wells, including detections at MW-1 (for TCE), MW-14 (for TCE), and MW-3 (for TCE and 1,1-DCE). In fact, six of the monitoring wells did not have any VOC detections, including MW-6, MW-7, MW-10, MW-11, MW-12, and MW-13.

Monitoring wells MW-4, MW-5, and PZ-2 each had only one PAL exceedance noted, which were all for TCE. TCE concentrations at MW-4 (1.6 ug/L), MW-5 (0.55 J ug/L), and PZ-2 (0.56 J) narrowly exceeded the PAL concentration of 0.5 ug/L. The TCE concentrations at MW-5 and PZ-2 are flagged as estimated concentrations.

Monitoring well MW-8 had concentrations for TCE (2 ug/L) and 1,1-Dichloroethene (1,1-DCE at 2.1 ug/L) that exceeded the PAL concentrations of 0.5 mg/L and 0.7 mg/L, respectively. As mentioned, monitoring wells MW-1 (6.1 ug/L) and MW-14 (5.4 ug/L) each had exceedances of the ES for TCE,

which is 5 ug/L. Monitoring well MW-3 (5.5 ug/L) also had a detection that narrowly above the ES standard for TCE (5 ug/L), but also observed a detection of 1,1-Dichloroethane (1,1-DCA) at 8.9 ug/L that exceeded the ES standard of 7 ug/L.

The VOC concentrations within the Outwash deposits were found to be slightly higher than the shallow monitoring wells. However, this direct comparison is biased since three of the piezometers (PZ-MW1A, PZ-MW1B, and PZ-MW1C) are completed at the source area and not at down-gradient or side-gradient positions which all of the shallow wells, with the exception of MW-1, are positioned within the Till unit. As summarized on Table 4, PAL exceedances were observed for 1,1-DCA (at PZ-MW1A and PZ-MW1B), cis-1,2-dichloroethene [cis-1,2-DCE] (at PZ-MW1A, PZ-MW1B, PZ-MW1C, and PZ-3), and 1,2-dichloroethane [1,2-DCA] (at PZ-MW1B), respectively. Exceedances of ES levels were observed for 1,1-DCE (at PZ-MW1A, PZ-MW1B, PZ-MW1C, and PZ-3), TCE (at PZ-MW1A, PZ-MW1B, PZ-MW1C, and PZ-3), cis-1,2-DCE (at PZ-MW1A, PZ-MW1B, and PZ-MW1C), as well as 1,1-DCA (at PZ-MW1C and PZ-3) and 1,2-DCA at PZ-MW1C.

The November 2020 subsurface investigation results indicate the deepest piezometer at the source area (PZ-MW1C) had the highest TCE concentration (48.9 ug/L), but also had the highest concentration for the daughter products of 1,1-DCE (146 ug/L) and vinyl chloride (7.9 ug/L). PZ-MW1C also had the highest number of VOC detections (seven; along with PZ-MW1B) and ES exceedances (5). Groundwater sampling results from both the water table monitoring wells and Outwash unit piezometers are presented on Figure 7.

Detected concentrations within the shallow monitoring wells and piezometers were nearly always less than the detections formerly reported at the facility (AECOM, 2016). A snapshot of some of the detections is summarized below.

Analyte (Concentrations in ug/L)	NR140 ES	NR140 PAL	Monitoring Location	2016 Results		2020 Results	
Trichloroethene	5	0.5	MW-1	6.7	>PAL & >ES	6.1	>PAL & >ES
			MW-3	4.0	>PAL	5.5	>PAL & >ES
			MW-4	2.4	>PAL	1.6	>PAL
			MW-8	2.9	>PAL	2	>PAL
			MW-10	1.3	>PAL	<0.26	< PAL concentration
1,1-Dichloroethane	850	85	PZ-3	1590	>PAL & >ES	1160	>PAL & >ES
1,1-Dichloroethene	7	0.7		45.9	>PAL & >ES	27.6	>PAL & >ES
cis-1,2-Dichloroethene	70	7		38.7	>PAL	42.5	>PAL
Trichloroethene	5	0.5		11.9	>PAL & >ES	10.8	>PAL & >ES
Vinyl chloride	0.2	0.02		3.9 J	>PAL & >ES	< 1.7	<PAL concentration

The only exception for TCE is the concentration at MW-3, which fluctuated slightly higher to a concentration of 5.5 ug/L. Note that the cis-1,2-DCE concentration at PZ-3 was observed to increase since 2016. However, since cis-1,2-DCE is a daughter product of TCE, its increase is seen as a positive indicator of natural attenuation processes. The remainder of the data indicated VOC concentrations are decreasing and offer further evidence of the natural attenuation processes occurring in the subsurface.

### 3.4 Soil Results

Soil samples were collected from four hand augers advanced within the western ditch of Douglas Street (HA-1, HA-2, HA-4) and near a drain discharge (HA-3) as illustrated on Figure 2. Samples were collected from depths between 3 and 4 ft bgs to aid in further delineation of PAH soil impacts along the ditch-line. The analyte list and soil sample locations were proposed based on sampling conducted in July 2016 (AECOM, 2016) for sump/roof drain cleanout work. Apparently, material collected in a subset of concrete enclosed roof drains and sumps, which were located both inside and outside of the former manufacturing building, indicated elevated PAH concentrations. Since at least some of the sumps appeared to ultimately discharge into the ditch running alongside Douglas Street, additional investigation of surface soils in the discharge area of the ditch was proposed. Collected samples were placed in proper laboratory containers and submitted to Pace in Green Bay, Wisconsin under chain-of-custody control in an ice filled cooler. Recovered samples were analyzed for PAHs using EPA Method 8270. Laboratory results are included in Appendix C and summarized on Table 5.

A review of Table 5 indicates that all of the PAH constituents were not detected above method detection levels at all three sample locations within the ditch (HA-1, HA-2, and HA-4). The only PAH detections were observed at HA-3, which was located in close proximity to the drain discharge previously identified as a potential migration pathway. However, the PAH concentrations observed at HA-3 are very low and below the most conservative WDNR Soil Residual Contaminant Levels (RCLs) as illustrated on Table 5.

Thus, based on the November 10, 2020 soil sampling results, any previous PAH detections in the ditch west of Douglas Street were very limited since no detections of PAH constituents were observed at HA-1, HA-2, and HA-3. Furthermore, PAH concentrations from samples next to the building's drain outfall (at HA-3) were also much lower than RCL concentrations (Table 6). Therefore, no further subsurface investigation is necessary to delineate soil impacts from historical site usage.

### 3.5 Well Abandonment

The 6-inch pipe, which was identified as the "east pipe" in a previous site investigation (AECOM, 2016), was found to extend to 20.5 ft bgs with water present at about 6.3 feet below grade. The suspected former test well protruded from the grass area just south of the north property line as illustrated on Figure 2. Previous investigations revealed that no VOC or PAH detections were observed from soil borings advanced in its vicinity during 2015 sampling activities.

Furthermore, an excavation around the test conducted in 2016 confirmed that the pipe was not associated with any subsurface structures, such as USTs, piping, etc. In addition, no soil staining or odors were noted. Combined with 2015 soil borings advanced adjacent to the pipe location, no identifiable adverse environmental impacts are associated with their presence or use. Since the steel casing was likely a historical "test well", the steel casing was abandoned on October 9, 2020 by Cascade Drilling, who provided a licensed water well driller following the requirements in NR 812.26. The east pipe was cut several feet below ground surface and disposed of. The well casing was then cement grouted and the excavation was backfilled. The well abandonment form is included in Appendix A5.

## 4.0 Discussion of Proposed Work Plan Completion

Several tasks from the Work Plan (2017a) and Work Plan Addendum (2017b) have not be completed so the new groundwater information provided in this report can be reviewed to improve decision making on future site investigation and management strategies. Specifically, the November 2020 subsurface investigation will be used to reevaluate the location and need for PZ-7 relative to achieving site closure. A discussion of the new subsurface data collected in 2020 and a new proposed location for PZ-7 is included in this report.

The most recent data indicate the highest concentrations are generally observed at the base of the Outwash unit (at the source area) and continue to result in ES exceedances for three constituents (1,1-DCE, TCE, and 1-1-DCA) at the furthest downgradient piezometer (PZ-3). As a result, proposed piezometer PZ-7 is still warranted to be installed off-site to evaluate the downgradient extents of the ES exceedances. However, to avoid further delays in the site investigation, it is proposed that PZ-7 be located in the public right-of-way of W. Main Street, which is also known as State Trunk Highway 15 (STH 15) as illustrated in Figure 8. This location is less than 300 feet from location previously proposed, but provides for a more-accessible location.

The bedrock elevation at the proposed PZ-7 location is estimated to be similar to what was observed onsite (Figure 4) - between 736 Ft MSL (PZ-3) and 759 Ft MSL (PZ-1). Assuming the ground surface is about 828 Ft MSL, PZ-7 is proposed to be advanced to the bedrock (approximately 75 to 95 ft bgs) and screened at the base of the glacial deposits and across the bedrock interface. These proposed screen interval elevations (between 735 and 755 Ft MSL) are similar to the elevations of the VOC ES Exceedances observed on-site. The same five-foot screened interval will be maintained.

A street-view illustration of the proposed location is provided in Figure 9, which indicates that several issues will need to be addressed including right-of-way access, avoidance of underground utilities, and vehicular protections during drilling. These issues are deemed to be less of a challenge than what obtaining access to the private Former Toy Company property have become. Thus, it is requested that the revised location of PZ-7 be approved so the remainder of the outstanding scope of work, which is summarized below, can be completed:

- Installation of the PZ-7, and the three remaining proposed piezometers for the subject property (including, PZ-4, PZ-5 and PZ-6), and
- Completion of the hydraulic conductivity testing of the monitoring wells and piezometers

No further changes to the outstanding Work Plan tasks are proposed, with the possible minor exception of the location of PZ-6. The current owner/operator continually utilize semi-trailers at their loading docks. Thus, to avoid disrupting on-going site activities and problems with future access, it is proposed that PZ-6 be shifted to the northeastern corner of the main building – approximately 65 feet north-northeast of its proposed location, as illustrated on Figure 8.

## 5.0 Summary

Results of the October/November 2020 site investigation indicate that the dissolved VOC impacts in the shallow water table Till unit west of the former manufacturing building is delineated (around wells MW-1, MW-3, and MW-14), and continue to indicate stable and slightly decreasing concentrations. Sampling of the Outwash unit piezometers (PZ-2, PZ-3, and source area piezometers PZ-MW1A, PZ-MW1B, and PZ-MW1C) revealed PAL and ES exceedances in groundwater for TCE, vinyl chloride, and other associated TCE breakdown byproducts (i.e., 1,1-DCE, 1,1-DCA, and 1,2-DCA). The highest concentrations were observed at the source area located south/southwest of the main building and immediately northwest the out-building located along the south property line (Figure 7). Further delineation of TCE and associated byproducts in the deep unconsolidated aquifer is required.

Hand-augered soil borings advanced within and near to the western ditch of Douglas St. indicate no other adverse environmental impacts to soil from operation of the former manufacturing facility. The basis for the Douglas St. ditch soil sampling were from PAH detections in sediment traps located adjacent to the building. Several PAH compounds were detected near the storm water discharge location (at HA-3), but were observed at very low concentrations – well below applicable RCLs. Furthermore, hand augers advanced within the ditch did not observe detections of any PAH compounds. Thus, no further investigations of the soils are warranted for the site.

Finally, a 6-diameter well casing that was originally identified along the north property line was abandoned. No visual or olfactory evidence of impacts were noted during excavation and no other structures or laterals were encountered. Therefore, no further investigation is warranted.

## 6.0 Qualifications

Conclusions presented in this report are based on our professional interpretation of information collected during this investigation and review of available information related to activities and data collected by previous environmental consultants. Our conclusions are limited by the accuracy and completeness of the information provided by others. Therefore, if additional information is disclosed or an alteration of the information occurs, the conclusions presented in this report may need to be revised. Conclusions and recommendations are based on conditions as revealed in soil borings completed at the time of assessment activities. Stratification lines shown on the soil boring logs represent approximate boundaries between soil types. Variations in soil types and subsurface conditions may exist both in horizontal and vertical directions away from the soil borings. Additionally, seasonal and annual fluctuation of the groundwater table may influence the distribution of hazardous substances causing variation in groundwater quality.

AECOM has prepared this report on behalf of FV Steel and Wire Company. AECOM assumes responsibility for the accuracy of the contents of this report subject to what is stated elsewhere in this section, but recommends that this report be used only for the purposes intended at the time this report was prepared. The report may be unsuitable for other uses and reliance on its contents by any other party is done at the sole risk of the user.

**Notes:**

- MW wells are monitoring wells less than 15 feet below ground surface. PZ wells are piezometers set between 50 and 80 feet below ground surface and monitor Quaternary Till or Outwash as noted.
- Units listed in micrograms per liter (ug/L)
- PZ-1, MW2 and MW9 could not be located in 2020.

RE: Project: 60428891 FMR FV STEEL+ WIRE CO  
Pace Project No.: 40218182

Dear Gary Braun:

Enclosed are the analytical results for sample(s) received by the laboratory on November 11, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Christopher Hyska

## QUALIFIERS

Project: 60428891 FMR FV STEEL+ WIRE CO

Pace Project No.: 40218182

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor, percent moisture, initial weight and final volume.

LOQ - Limit of Quantitation adjusted for dilution factor, percent moisture, initial weight and final volume.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: 60428891 FV WIRE & STEEL  
Pace Project No.: 40218620

Dear Gary Braun:

Enclosed are the analytical results for sample(s) received by the laboratory on November 18, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Green Bay

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Christopher Hyska  
christopher.hyska@pacelabs.com

## QUALIFIERS

Project: 60428891 FV WIRE & STEEL

Pace Project No.: 40218620

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor, percent moisture, initial weight and final volume.

LOQ - Limit of Quantitation adjusted for dilution factor, percent moisture, initial weight and final volume.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

- 1q Sample was received with headspace.
- B Analyte was detected in the associated method blank.
- D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
- L2 Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
