Re: Summary Letter Report and Work Plan, Letsos Property - Belknap Street
902-904 Belknap Street, Superior, WI 54880
BRRTS# 02-16-560359

Dear Mr. Richard:

This letter report presents a summary of the site history and recent activities performed as part of the investigation of contaminated soil at the 902-904 Belknap Street property including contaminated soil removal, indoor air sampling and remedial actions that have occurred since the last letter report submittal in January 2017. The report also provides an interpretation of the results as well as recommendations for additional work necessary to complete the plume delineation and continue to monitor contaminant concentrations on the site.

Site History

Soil contamination was first identified at the site when soil samples collected from borings advanced on and directly adjacent to the site by TRC Environmental Corporation as part of a Phase 2.5 Environmental Site Investigation completed prior to the Belknap Street reconstruction detected tetrachloroethene (PCE) and trichloroethene (TCE).

A Phase II Environmental Site Assessment completed by Environmental Troubleshooters identified soil contamination within a room in the southwest corner of the basement and immediately south of the outside basement door. Analytical results detected the presence of chlorinated solvents that appeared to be related to dry cleaning at concentrations that required further assessment. On February 24, 2016, the Douglas County Department of Health and Human Services (DCDHHS) collected two indoor air samples at the property, one in the basement and one in the 2nd floor apartment. The building tenants were notified of the concentrations of PCE, TCE, and vinyl chloride exceeding indoor air vapor action levels (VALs).

MSA was contracted in March 2016 to address the identified soil contamination on the Property. MSA collected a soil sample from the exposed basement soils in the southwest room of the basement and a water sample from the basement sump to determine existing concentrations and provide preliminary evaluation for planned treatment and disposal options. MSA also obtained Sanborn maps of the site and the immediate vicinity from Historical Information Gatherers (HIG) on March 17, 2016 and identified a building on the existing site since at least 1914. The site appears to have been used as a creamery from at least 1949 through 1955 and as a dry cleaner from at least 1967 through 1972. Based on this information, MSA advanced five soil borings on April 18, 2016 and ten soil samples and three groundwater samples were collected to determine the magnitude and extent of contamination on the site. Sampling results indicated that chlorinated solvent soil concentrations that exceeded Wisconsin Department of Natural Resources (WDNR) direct contact residual contaminant levels (RCLs) were present within four feet of the ground surface beneath the footprint of the building and petroleum contaminated soil and groundwater were identified on the north side of the building. MSA recommended the excavation of contaminated soils within the earthen section of the basement in order to mitigate the soil direct contact and vapor intrusion threats to the building. A letter report was submitted to the WDNR on January 10, 2017 outlining the investigative work completed and describing the commencement of site excavation work. The location

of the soil borings is shown on **Figure 2** and the soil and groundwater analytical results are presented in **Table 1** and **Table 2**.

Contaminated Soil Removal and Indoor Air Sampling

Excavation activities in the basement were initiated on December 2, 2016. After the removal of several yards of contaminated material, it was determined that the soil/debris in the basement was actually on top of a poured concrete floor with a raised concrete slab which existed several feet lower than the rest of the basement. The contaminated soil was fully excavated on December 22, 2016, with a total of approximately 20 cubic yards of soil/debris were excavated and transferred into a lined on-site roll off container and transported to the Vonco V Landfill located in Duluth, Minnesota for disposal. As a means of evaluating conditions below the slab, two cores were drilled by Twin Ports Testing and two soil samples, HA-1 and HA-2, were collected under the slab using a hand auger by MSA. Based on the concentration of contaminants detected in the soil samples collected under the slab, it was determined that it would be more effective to leave the concrete in place as a barrier to the contamination than to remove it. Clean sand backfill and a drain tile system were installed in the areas of lower elevation and a new concrete floor was installed over the entire floor of the basement room. A sealed sump was also installed, which is currently connected to the City of Superior sanitary sewer. Manifests for soil disposal are included in **Attachment A** and two cross sections of the basement floor showing pre and post excavation arrangement are shown on **Figure 3**.

On May 17, 2017, four 24-hour indoor air samples, IA-1 through IA-4, were collected at the site using summa canisters with a 24-hour sampling valve. The canisters were placed based on guidance provided in the WDNR publication RR-800 *"Addressing Vapor Intrusion at Remediation and Redevelopment Sites in Wisconsin"* in the 902 Belknap Street (902 Building) main building office space, upstairs apartment, basement and in the 904 Belknap Street (904 building). A second indoor air sample, BASEMENT ROOM, was collected from the basement location on June 8, 2017 to confirm analytical results from the first sampling event. Based on concentrations detected in the prior sampling events, it was determined that remedial action was necessary in order to decrease contaminant concentration in the indoor air. An indoor air sample, Indoor Air 9/7/17, was collected in the main office space on September 7, 2017 to confirm concentrations in the occupied section of the building prior to the installation of an indoor air mitigation system. In late September 2017, an indoor air mitigation system was installed in the room in the southwest corner of the basement and all pipes, holes and sumps were sealed. Additional indoor air samples, IA-5 through IA-8, were collected at all four previous sampling locations on October 25, 2017 to determine the effectiveness of the remediation measures. The sampling locations are shown on **Figure 2**.

Indoor Air Sampling Results

Based on building use, small commercial Vapor Action Limits (VALs) were used to evaluate indoor air contaminant concentrations in the 902-904 Belknap Street buildings. The 902 and 904 Belknap Street buildings are both used as office space, with a limited-use residential rental unit located on the 2nd floor of the 902 Belknap Street building. This unit is not occupied full time, and is rented out on a nightly basis. For this reason, the small-commercial VALs were used to evaluate this space as well.

Analytical results from the May 17, 2017 indoor air sampling event detected twenty-nine compounds above their respective method detection limits in the four indoor air samples collected. PCE was detected at 199 µg/m³ and TCE was detected at 20 µg/m³ in the 902 Belknap main office sample exceeding their respective VALs. TCE was detected at 13.2 µg/m³ in the 902 building upstairs apartment sample exceeding its VAL. Naphthalene was detected at 24.2 µg/m³, 1,2,4-trimethylbenzene was detected at 3,340 µg/m³, 1,3,5-trimethylbenzene was detected at 1,210 µg/m³ and total xylenes were detected at 8,050 µg/m³ in the 904 building sample, all exceeding their respective VALs. PCE was detected at 945 µg/m³ and TCE was detected at 70.7 µg/m³ in the 902 building basement sample exceeding their respective VALs. No

902-904 Belknap Street
May 8, 2018

other detected concentrations exceeded their respective VALs. A confirmation sample from the basement collected on June 8, 2017 detected PCE at 260 µg/m³ and TCE was detected at 54.4 µg/m³ in the 902 Belknap main office sample exceeding their respective VALs.

Analytical results from the September 7, 2017 indoor air sample collection prior to the installation of the indoor air mitigation system detected twenty-four compounds above their respective method detection limits but no concentrations exceeded their respective VALs.

Analytical results from the October 25, 2017 indoor air sampling event detected twenty-five compounds above their respective method detection limits in the four air samples collected. PCE was detected at 214 µg/m³ and TCE was detected at 35.7 µg/m³ in the 902 building basement sample exceeding their respective VALs. No other detected concentrations exceeded their respective VALs. The indoor air sampling results are shown on **Table 3** and the laboratory analytical reports for the indoor air sampling events are provided in **Attachment B**.

Remedial Actions

In addition to the indoor air mitigation system installed in late September 2017, a radon mitigation system was installed by Shubitz Pluming of Duluth, Minnesota by the property owner as a preemptive remedial action to ventilate volatile organic compounds from the basement room in April 2018. The radon system is tied into the sump and drain tile installed after the basement room was excavated. A Homeaire model RN104 fan was connected to system to provide a vacuum and the exhaust was piped out of the basement to an exhaust port on the roof. An operation and maintenance manual including information about system parts and inspection items will be prepared for the system prior to pursuing closure for the site. The manual may be used by the current and future building owners to ensure that regular system inspection and proper maintenance takes place. A photographic log of the installed system and components and the specifications of the installed fan are provided in **Attachment C**.

A pressure field extension (PFE) test will be performed on the system in Spring 2018 to ensure that the system meets depressurization guidelines for the building. Indoor air samples will be collected concurrent with the PFE test at previous indoor air sampling locations (basement, main floor, upstairs apartment, and 904 Belknap Street building) to verify that the system is effectively reducing indoor air contaminant concentrations.

Conclusions and Recommendations

Soil samples collected and analyzed from the previously advanced five soil borings advanced at the site detected chlorinated solvents in five of the six soil samples collected from borings GP-2, GP-3 and GP-4 but at concentrations below their respective residual contaminant levels (RCLs). Additional soil samples collected from the hand auger borings in the basement of the building also indicated the presence of chlorinated solvents exceeding their respective RCLs. Based on sampling results, it appears that the extent of chlorinated contaminated soils that exceed their RCLs has been delineated and is limited to soils under the building in the vicinity of the basement room. Benzene was also detected above its RCL in the soil sample collected from the 7.5-10 foot interval collected from boring GP-1 but it appears to be associated with the BRRTS site #03-16-560358 at the intersection of Belknap Street and Clough Avenue and will be excavated concurrently with the road construction activities on Belknap Street in 2018.

Groundwater samples were collected and analyzed from the previously advanced soil borings GP-1, GP-4, GP-5 and from the sump in the basement room. Samples were not able to be collected from soil borings GP-2 and GP-3 due to limited volume of groundwater in the borings. Laboratory analytical results detected concentrations of chlorinated solvents exceeding their respective Enforcement Standards (ES) in the samples collected from borings GP-4, GP-5 and the sump in the basement room. Benzene was also detected above its ES in the sample collected from boring GP-1. It appears the

902-904 Belknap Street
May 8, 2018

contamination related to chlorinated solvents is concentrated in the vicinity of the basement room but the full extent is currently not fully delineated. The benzene detected in the groundwater sample from GP-1 appears to be associated with the BRRTS site #03-16-560358 at the intersection of Belknap Street and Clough Avenue.

Based on the indoor air sampling results, it appears that the remediation measures including excavation of the contaminated material, installation of the indoor air mitigation system and sealing of possible intrusion pathways has effectively reduced the levels of indoor air contamination at the site. Sampling following the excavation detected contaminant concentrations exceeding VALs in each sampling location. The detection of petroleum compounds and a lack of chlorinated solvents in indoor air sample IA-4 collected in the 904 building during the May 17, 2017 sampling event does not appear to be related to the contamination identified during this investigation and may be related to construction events taking place on Belknap Street during the sampling interval. Concentrations of PCE and TCE have shown a substantial decrease in concentration in each consecutive sampling event to the level that only basement concentrations currently exceed small commercial VALs. Concentrations of other contaminants of concern have also shown a general decrease in all sampling locations indicating that the remediation measures have been effective.

Based on the results of the indoor air sampling, MSA recommends additional quarterly indoor vapor sampling for one year in order to continue to monitor and determine trends of the contaminant concentrations in the indoor air. Based on the results of the sampling, adjustments may be made to the indoor air mitigation system to increase effectiveness if necessary. MSA also recommends additional groundwater sampling in the vicinity of GP-4 in order to determine the magnitude and extent of groundwater contamination.

LABORATORY ANALYTICAL REPORTS

May 26, 2017

MSA Professional Services

Sample Delivery Group: L910291
Samples Received: 05/18/2017
Project Number: 17711000
Description: 902-904 Belknap Street
Site: SUPERIOR, WI
Report To: Jeff Anderson
332 W. Superior Street, Suite 600
Duluth, MN 55802

Entire Report Reviewed By:

John Hawkins
Technical Service Representative

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by ESC is performed per guidance provided in laboratory standard operating procedures: 060302, 060303, and 060304.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times. All MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

ONE LAB. NATIONWIDE.

Abbreviations and Definitions

| | |
|------|--|
| SDG | Sample Delivery Group. |
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| ND | Not detected at the Reporting Limit (or MDL where applicable). |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| RPD | Relative Percent Difference. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| Rec. | Recovery. |

Qualifier Description

| | |
|---|---|
| J | The identification of the analyte is acceptable; the reported value is an estimate. |

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our "one location" design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be **YOUR LAB OF CHOICE**.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times. All MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our "one location" design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be **YOUR LAB OF CHOICE**.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times. All MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

| | | |
|------------------------------|--|-----------------|
| MDL | Method Detection Limit. | ¹ Cp |
| ND | Not detected at the Reporting Limit (or MDL where applicable). | ² Tc |
| RDL | Reported Detection Limit. | ³ Ss |
| Rec. | Recovery. | ⁴ Cn |
| RPD | Relative Percent Difference. | ⁵ Sr |
| SDG | Sample Delivery Group. | ⁶ Qc |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. | ⁷ GI |
| U | Not detected at the Reporting Limit (or MDL where applicable). | ⁸ AI |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. | ⁹ SC |
| Dilution | If the sample matrix contains an interfering material, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. | |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. | |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. | |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. | |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. | |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. | |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. | |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. | |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. | |

Qualifier Description

| | |
|----|---|
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our "one location" design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be **YOUR LAB OF CHOICE**.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times. All MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Tentatively Identified compounds (TIC) refers to substances not present in the list of target compounds. Therefore, not all TICs are identified and quantitated using individual standards. TIC listings are prepared utilizing a computerized library search routine of electron impact mass spectral data and evaluation of the relevant data by a mass spectral data specialist. Quantitation is accomplished by relative peak area of the TIC compared to that of the nearest internal standard from the total ion chromatogram. TICs are identified and quantitated only if the peak area is 10% or more of that of the nearest internal standard.

Tentatively Identified compounds (TIC) refers to substances not present in the list of target compounds. Therefore, not all TICs are identified and quantitated using individual standards. TIC listings are prepared utilizing a computerized library search routine of electron impact mass spectral data and evaluation of the relevant data by a mass spectral data specialist. Quantitation is accomplished by relative peak area of the TIC compared to that of the nearest internal standard from the total ion chromatogram. TICs are identified and quantitated only if the peak area is 10% or more of that of the nearest internal standard.

Tentatively Identified compounds (TIC) refers to substances not present in the list of target compounds. Therefore, not all TICs are identified and quantitated using individual standards. TIC listings are prepared utilizing a computerized library search routine of electron impact mass spectral data and evaluation of the relevant data by a mass spectral data specialist. Quantitation is accomplished by relative peak area of the TIC compared to that of the nearest internal standard from the total ion chromatogram. TICs are identified and quantitated only if the peak area is 10% or more of that of the nearest internal standard.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

| | | |
|------------------------------|--|-----------------|
| MDL | Method Detection Limit. | ¹ Cp |
| ND | Not detected at the Reporting Limit (or MDL where applicable). | ² Tc |
| RDL | Reported Detection Limit. | ³ Ss |
| Rec. | Recovery. | ⁴ Cn |
| RPD | Relative Percent Difference. | ⁵ Sr |
| SDG | Sample Delivery Group. | ⁶ Qc |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. | ⁷ GI |
| U | Not detected at the Reporting Limit (or MDL where applicable). | ⁸ AI |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. | ⁹ SC |
| Dilution | If the sample matrix contains an interfering material, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. | |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. | |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. | |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. | |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. | |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. | |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. | |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. | |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. | |

Qualifier Description

| | |
|---|---|
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
|---|---|

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our "one location" design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be **YOUR LAB OF CHOICE**.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

RADON FAN SPECIFICATIONS

RN104 PRODUCT SPECIFICATIONS

The following chart shows fan performance for the RN104 Radon Fan:

| Typical CFM Vs Static Suction "WC | | | | |
|-----------------------------------|-----|------|------|------|
| | 0" | 0.5" | 1.0" | 1.5" |
| RN104 | 112 | 95 | 70 | 40 |

| Maximum Recommended Operating Pressure* | |
|---|-----------------------------------|
| RN104 | 1.8" W.C. (Sea Level Operation)** |

*Reduce by 10% for High Temperature Operation

**Reduce by 4% per 1000 feet of altitude

| Power Consumption @ 120 VAC | |
|-----------------------------|---------------|
| RN104 | 45 - 66 watts |

RN104 Inlet/Outlet: 4.5" OD (4.0" PVC Sched 40 size compatible)

RN104 Inlet/Outlet: 5.875" OD

Mounting: Mount on the duct pipe or with optional mounting bracket.

Recommended ducting: 3" or 4" Schedule 20/40 PVC Pipe

Storage temperature range: 32 - 100 degrees F.

Normal operating temperature range: -20 - 120 degrees F.

Maximum inlet air temperature: 80 degrees F.

Size: 9.5H" x 8.5" Dia.

Weight: 6 lbs.

Continuous Duty

Thermally Protected

Class B Insulation

3000 RPM

Residential Use Only

Rated for Indoor or Outdoor Use

LISTED
Electric Fan

Conforms to
UL STD. 507

Certified to
CAN/CSA STD.
C22.2 No.113
