Re: Site Investigation Work Plan
BRRTS #: 02-41-576336
FID #: 241828620
Sunrise Shopping Center
2410-2424 10th Avenue & 1009 Marquette Avenue
South Milwaukee, Wisconsin 53172

Mr. Neumann:

Following the submission of a *Site Investigation Report Addendum* dated October 19, 2015, for the Sunrise Shopping Center (Site), Wisconsin Department of Natural Resources (WDNR) issued a response letter dated March 27, 2017. In the letter, WDNR indicated that further sampling activities were required before the Site Investigation could be considered complete per NR 716 requirements. The letter also requested that updated information be added to the Site Investigation Report. The March 2017 letter also established a timeline for the submission of a work plan, subsequent field activities, and the submission of an amended Site Investigation Report.

This *Site Investigation Work Plan* (SIWP) proposes additional soil, groundwater, and vapor sampling as provided in more detail below. Other information requested in WDNR's March 2017 letter will be included in the *Site Investigation Report Amendment* (SIR Amendment).

SUMMARY OF PREVIOUS SITE INVESTIGATIONS

Groundwater Contamination

During initial investigations, six (6) temporary monitoring wells (TW-1 to TW-6) were installed. Subsequently, five (5) permanent monitoring wells (MW-1 to MW-5) were installed. MW-3 replicated TW-5, and MW-4 replicated TW-6. MW-1 and MW-5 generally replicated TW-4 and TW-2, respectively. Later, a sixth monitoring well (MW-201) was installed. Figure B.1.b.2 depicts the locations of all temporary and permanent monitoring well locations.

After collecting groundwater samples, the temporary monitoring wells were abandoned. Each permanent monitoring well has been sampled twice, with the exception of MW-3, which was damaged by snow removal operations. A historical summary of all groundwater samples

collected VOCs and PAHs since November 2014 is summarized in Tables A.1.A (VOCs) and A.1.B (PAHs). Results are compared to Preventative Action Limits (PALs) and Enforcement Standards listed in Table 1 of Wisconsin Administrative Code Chapter NR 140. A summary is provided below:

VOCs

- Perc groundwater contamination was originally identified in TW-2. The two (2) samples collected in MW-5, which generally replicated TW-2, confirmed the presence of Perc at concentrations exceeding the PAL. The most recent (February 2016) result of 0.0083-mg/L is above both the PAL and the Enforcement Standard.
- The February 2016 groundwater sample collected from MW-4 indicated a Benzene concentration above the PAL, but two (2) previous samples (TW-6 and first sample of MW-4) did not indicate any detectable concentrations of VOCs.

PAHs

- Benzo(b)fluoranthene and Chrysene were observed in TW-3 marginally above the PALs.
- PAHs were observed at concentrations above the PALs in TW-4. Two (2) replicate samples from MW-1, installed to generally replicate TW-4 and within a location of known PAH soil contamination, do not indicate any observed exceedances.
- PAHs were observed at concentrations above the Enforcement Standards in TW-5. The groundwater sample collected from MW-3 (which replicated TW-5) indicates only one (1) PAH constituent (Chrysene) at a concentration above the PAL. No additional samples could be collected from MW-3 due to damage to the well from snow removal operations.
- Chrysene was observed at a concentration above the PAL in TW-6 and the first sample collected from MW-4 indicated PAL exceedances for Benzo(b)fluoranthene and Chrysene. The latest round of sampling from MW-4 did not indicate any PAH concentrations above the PALs.
- Benzo(b)fluoranthene and Chrysene were observed at concentrations above the PALs in MW-201, but no PAH concentrations above the PALs have been observed in the most recent sample.

In summary, Perc contamination is observed in MW-5 at a concentration exceeding the Enforcement Standard, and the Benzene concentration in MW-4 is marginally above the PAL. Based upon the most recent groundwater sampling completed in February 2016, all PAHs are at concentrations below the PALs. Figures B.3.b.1 (VOCs) and B.3.b.2 (PAHs) provide the locations of observed PAL exceedances and associated contaminants and concentrations.

Soil Contamination

Multiple rounds of soil sampling have been performed during previous Site Investigations. Figure B.1.b.2 depicts the locations of all soil borings installed between November 2014 and September 2016. Soil contamination has been identified for Volatile Organic Compounds (VOCs) and Polynuclear Aromatic Hydrocarbons (PAHs). To reflect the March 2017 update to the WDNR Residual Contaminant Levels (RCLs), all previous soil sample results have been re-evaluated and compared to the current cleanup objectives. The results of the updated evaluation are provided in Attachment A as Tables A.2.A (VOCs) and A.2.B (PAHs). Results are compared

to the RCLs for protection of groundwater (GW RCL) and both the Non-Industrial (Residential) and Industrial Direct Contact (DC) RCLs.

Based upon re-evaluation of the data, contaminant concentrations exceeding the applicable (GW and Industrial DC) RCLs are observed for the VOCs Benzene, 1,1-Dichloroethane (DCA), Methylene chloride, Tetrachloroethene (Perc), and Trichloroethene (TCE) and the PAHs Benzo(a)pyrene, Benzo(b)fluoranthene, Chrysene, and Naphthalene. Figure B.2.a.1 in Attachment B provides the locations of observed PAH contamination. Figure B.2.a.2 provides the locations for VOC soil contamination.

Contamination Along Southern Property Boundary: Benzene, Methylene chloride, and PAH contamination are located within the south-central portion of the Site. Benzene contamination within the southern portion of the property has been fully defined (see Figure B.2.a.2.a). The single MC exceedance is observed in soil boring GP-209 at a concentration above the Limit of Detection (LOD), but below the Limit of Quantification (LOQ). Methylene chloride is not observed in any of the other 67 soil samples collected on-site. Further, Methylene chloride is a common laboratory artifact. Therefore, while appropriate measures will be implemented to address the observed Methylene chloride exceedance in GP-209, no further Site Investigation activities are proposed.

As shown in Figure B.2.a.1.a, the extent of Benzo(a)pyrene, Benzo(b)fluoranthene, and Chrysene contamination is nearly delineated with only delineation to the south of soil boring GP-302 missing. However, further delineation to the south requires off-site access since the southern property boundary is approximately 7-ft from GP-302. Previous requests for access to the property to the south of the Site have been denied, although an additional new request has been submitted recently. (It is believed that the ownership of the property to the south may have recently changed.) An access request has been submitted to the owner of the neighboring property to the south.

Former AST Area: Another area of PAH contamination is observed in the central/east-central portion of the Site, associated with known leaking aboveground storage tank/s and for which a Case Closure was previously issued in May 1998. As shown in Figure B.2.a.1.b, PAHs are observed in soil borings GP-8, GP-101, and GP-102, all at a sample depth of 2-ft to 4-ft bgs. The deeper sample collected from GP-8R vertically delineates the PAH contamination. Benzo(a)pyrene, Benzo(b)fluoranthene, and Chrysene are observed at concentrations above the applicable RCLs in GP-8 and GP-101, but not in GP-9 and GP-10, which were installed in between GP-8 and GP-101. Only Chrysene is observed in GP-102 above the applicable RCL.

Former Heating Oil UST Area: The Naphthalene contamination is limited to an isolated area behind (west of) the 2414B tenant space of the main building (see Figure B.2.a.1). Soil contamination is only observed above the RCL in soil boring GP-13 at a depth of 4-ft to 6-ft bgs. Delineation of Naphthalene contamination has been completed both horizontally and vertically. No further soil sampling is proposed for Naphthalene.

Former Drycleaner Area: Chlorinated VOC (CVOC) contamination is located within the west-central portion of the Site, inside and behind (west of) the 2410-2412 tenant spaces. Figure B.2.a.2 shows the locations of observed VOC contamination. Three (3) CVOCs are

observed at concentrations above the applicable RCLs within the west-central portion of the Site, including DCA, Perc, and TCE.

DCA contamination is observed in soil boring GP-2 at a depth of 8-ft to 10-ft bgs. Similar to Methylene chloride, DCA was only observed in one (1) of 68 total soil samples analyzed for VOCs.

As observed in Figure B.2.a.2.b, PCE soil contamination is observed in the area of the Site where the former Sunbrite Cleaners drycleaning facility was located (the 2410 tenant space). Available data indicate that two (2) areas of contamination appear to be present: one (1) below the tenant space in the reported former location of the drycleaning machines, the other to the west of the building within the area of the service drive. PCE concentrations are observed exceeding the GW RCL in 16 soil borings. Three (3) of the soil borings (GP-114, GP-202, and GP-407) are observed with TCE concentrations above the GW RCL (see Figure B.2.a.2.c). Two (2) additional soil borings (GP-402 and GP-405) with elevated LODs due to heavy sample dilution are also considered to show TCE exceedances.

Vapor Intrusion

Due to the presence of VOCs in the subsurface near and inside the buildings, vapor sampling has been performed as part of the Site Investigations. Vapor sampling has consisted of sub-slab samples, soil gas samples, and indoor air samples. During the initial vapor sampling, sub-slab samples were collected from below the Ace Hardware building addressed as 1009 Marquette Avenue, as well as the multi-tenant spaces within the commercial strip and addressed as 2410-2414B 10th Avenue. Subsequent investigations have been isolated to the 2412 and 2414 tenant spaces. Figure B.1.b.2 depicts the locations of all vapor sampling locations.

A summary of the various vapor samples is summarized in Tables A.4.A (sub-slab), A.4.B (soil gas), and A.4.C (indoor air). Results of sub-slab and soil gas samples are compared to the Vapor Risk Screening Levels (VRSLs), and indoor air samples are compared to the Vapor Action Levels (VALs), as taken from the *Quick Look-Up Table, Indoor Air Vapor Action Levels and Vapor Risk Screening Levels*.

Review of the summary tables indicates that sub-slab vapor sample SS-6, collected in the 2410 tenant space, is observed with an exceedance of the Perc VRSL. Sub-slab vapor sample SS-101, collected in the adjacent (2412) tenant space, is observed with an exceedance of the Naphthalene VRSL. However, neither the soil gas nor the indoor air samples from the two (2) tenant spaces indicated contaminant concentrations above the applicable standards. No additional vapor intrusion sampling is proposed.

PROPOSED FIELD ACTIVITIES

Groundwater Sampling

In the March 2017 letter, WDNR requested additional groundwater sampling to address the possibility of increasing VOC concentrations with time. Therefore, a complete round of groundwater sampling will be collected from all accessible monitoring wells and analyzed for VOCs. The groundwater samples collected from MW-4 and MW-201 will also be analyzed for PAHs to confirm the February 2016 results, which indicate no exceedances of the PALs. No

PAH analysis will be performed on MW-1, MW-2, or MW-5, which have twice shown no PAH concentrations above the PALs. (If possible MW-3 will be sampled using a peristaltic pump and analyzed for VOCs and PNAs.)

In addition to the collection of groundwater samples from all existing and accessible monitoring wells, one (1) new monitoring well will be installed to the west of MW-5 for VOC analysis, provided off-site access is granted. A request for access has been submitted to the railroad, owner of the property to the west.

Soil Sampling

Contamination Along Southern Property Boundary: A total of six (6) soil borings are proposed for PAH delineation to the south of GP-302. Three (3) on-site soil borings (GP-501 to GP-503) are proposed within the southern-most portion of the property, and three (3) off-site soil borings (GP-501A to GP-503A) are proposed, provided off-site access is granted. Proposed sample locations are shown in Figure B.2.a.1.a.

Soil samples for horizontal delineation of contamination will be collected from each soil boring at a pre-determined sample depth of 2-ft to 4-ft below ground surface (bgs), the depth at which contamination has been previously identified. One (1) soil sample will be collected at 8-ft to 10-ft bgs from the soil boring/s installed directly south of GP-302 to confirm the previously defined vertical delineation and to complete updated soil cross-sections. All soil samples will be analyzed for PAHs.

Former AST Area: A total of six (6) soil borings (GP-504 and GP-509) are proposed for further PAH delineation. Samples are proposed to be installed around GP-8 and GP-102 (see Figure B.2.a.1.b). Sampling is not proposed around GP-101, which is already near the property boundary. All soil samples will be collected from 2-ft to 4-ft bgs and analyzed for PAH.

Former Drycleaner Area: A total of 16 soil borings are proposed for CVOC delineation, including three (3) off-site soil samples. Figure B.2.a.2.b provides the locations of the proposed delineation soil borings. Soil samples will be collected for VOCs, generally at 2-ft to 4-ft and 6-ft to 8-ft bgs (inside the building) or 8-ft to 10-ft bgs (outside of the building).

DCA contamination in GP-2 is delineated to the north and south. Three (3) soil boring locations are proposed for DCA delineation. To complete horizontal delineation, one (1) soil boring will be completed to the east (GP-510) and to the west (GP-511), with soil samples collected at a depth of 8-ft to 10-ft bgs. Additionally, soil boring GP-2 will be replicated (GP-2R), with soil samples collected at 6-ft to 8-ft bgs and 10-ft to 12-ft bgs for vertical delineation.

A total of 13 proposed soil boring locations are proposed for PCE/TCE delineation. The soil borings are intended to better define the observed contamination and/or to verify that the observed impact inside and outside of the building are separated contaminant areas. Two (2) soil borings (GP-512 and GP-513) will be installed in front (east) of tenant spaces 2410 and 2412, and five (5) soil borings (GP-514 to GP-518) are proposed for inside of the two (2) impacted tenant spaces. Because of continued refusal at approximately 8-ft bgs while using the hand-cart direct-push unit, vertical delineation inside of the building may not be possible.

To complete horizontal delineation outside the western wall of the building, two (2) soil borings (GP-519 and GP-520) will be installed on-site behind the building, and three (3) soil borings (GP-521 to GP-523) will be installed off-site (if access is granted). To complete vertical delineation of contamination observed in soil borings GP-309 and GP-311 at 8-ft to 10-ft bgs, soil boring GP-311 (which has the higher contaminant concentrations) will be replicated. Soil samples from GP-311R will be collected at 10-ft to 12-ft bgs (or deeper per field observations). Vertical delineation outside of the building is otherwise completed by soil samples collected at 8-ft to 10-ft.

Impacts to Receptors

To investigate potential manmade contaminant migration pathways, a utility survey will be conducted within units 2410 and 2412. The location and direction of utilities outside the western wall of the building will also be verified, including lateral feeds into Ace Hardware and tenant spaces 2410-2414B.

Remedial Actions

To better define the Perc source area inside the former drycleaner space and assess potential remedial action options that will be required to reduce the observed contamination, additional samples have been proposed (see discussion above). Figure B.2.a.2.b provides the locations of the proposed soil borings inside of the former drycleaner (2410) and adjacent tenant space (2412).

Schedule

Site investigations will begin with 30-days of this SIWP submission. The SIR Amendment will be submitted within 60-days after completion of the field activities, as required per NR 716.15(1).

If you have any questions, require additional information, or would like to discuss the proposed locations, please contact me at 847-573-8900 extension 580. Thank you for your time and assistance.

Sincerely,
DAI Environmental, Inc.

Christopher Cailles, P.E.
Project Engineer

¹ – Preventive Action Limits (PALs) taken from Wisconsin Administrative Code, Chapter NR 140, Table 1

² – Enforcement Standards (ES) taken from Wisconsin Administrative Code, Chapter NR 140, Table 1

Bold – Concentration exceeds the PAL

Underlined – Concentration exceeds the PAL and the ES

* – Limit of detection reported greater than most stringent applicable standard in an undiluted sample (i.e., lowest achievable limit); “non-detect” concentration not taken as exceedance per NR140.14(3)(a)

(J) – Concentration reported by the laboratory above the Limit of Detection, but below the Limit of Quantification

NL – Not Listed in Wisconsin Administrative Code

PNAs via USEPA Method SW8270SIM

NOTE – MW-1 generally duplicated TW-4

¹ –Soil Residual Contaminant Levels (RCLs) based on protection of groundwater (GW) and a dilution factor of 2 taken from the Soil RCL spreadsheet (March 2017 update) generated by the Wisconsin Department of Natural Resources (WDNR) Remediation and Redevelopment Program in compliance with Chapter NR 720 of the Wisconsin Administrative Code

² – Soil RCL for Direct Contact (DC) based upon Non-Industrial (Residential) property classifications taken from the WDNR Soil RCL spreadsheet (March 2017 update)

³ – Soil RCL for DC based upon Industrial property classifications taken from the WDNR Soil RCL spreadsheet (March 2017 update)

Bold – Concentration exceeds the most stringent applicable RCL (GW RCL or Industrial DC RCL)

Underlined – Concentration exceeds the Industrial DC RCL

Italics – Concentration exceeds the Non-industrial DC RCL (property is commercial, not residential)

* – Limit of detection reported greater than most stringent applicable standard, generally in an undiluted sample (i.e., lowest achievable limit); “non-detect” concentration not taken as exceedance per NR 720.07(2)(d)(1)

(J) – Concentration reported by the laboratory above the Limit of Detection, but below the Limit of Quantification

NL – Not Listed

VOCs via USEPA Method SW8260B/5035

¹ –Soil Residual Contaminant Levels (RCLs) based on protection of groundwater (GW) and a dilution factor of 2 taken from the Soil RCL spreadsheet (March 2017 update) generated by the Wisconsin Department of Natural Resources (WDNR) Remediation and Redevelopment Program in compliance with Chapter NR 720 of the Wisconsin Administrative Code

² – Soil RCL for Direct Contact (DC) based upon Non-Industrial (Residential) property classifications taken from the WDNR Soil RCL spreadsheet (March 2017 update)

³ – Soil RCL for DC based upon Industrial property classifications taken from the WDNR Soil RCL spreadsheet (March 2017 update)

Bold – Concentration exceeds the most stringent applicable RCL (GW RCL or Industrial DC RCL)

Underlined – Concentration exceeds the Industrial DC RCL

Italics – Concentration exceeds the Non-industrial DC RCL (property is commercial, not residential)

* – Limit of detection reported greater than most stringent applicable standard, generally in an undiluted sample (i.e., lowest achievable limit); “non-detect” concentration not taken as exceedance per NR 720.07(2)(d)(1)

(J) – Concentration reported by the laboratory above the Limit of Detection, but below the Limit of Quantification

NL – Not Listed

VOCs via USEPA Method SW8260B/5035

Samples collected on February 19, 2016

¹ –Soil Residual Contaminant Levels (RCLs) based on protection of groundwater (GW) and a dilution factor of 2 taken from the Soil RCL spreadsheet (March 2017 update) generated by the Wisconsin Department of Natural Resources (WDNR) Remediation and Redevelopment Program in compliance with Chapter NR 720 of the Wisconsin Administrative Code

² – Soil RCL for Direct Contact (DC) based upon Non-Industrial (Residential) property classifications taken from the WDNR Soil RCL spreadsheet (March 2017 update)

³ – Soil RCL for DC based upon Industrial property classifications taken from the WDNR Soil RCL spreadsheet (March 2017 update)

Bold – Concentration exceeds the most stringent applicable RCL (GW RCL or Industrial DC RCL)

Underlined – Concentration exceeds the Industrial DC RCL

Italics – Concentration exceeds the Non-industrial DC RCL (property is commercial, not residential)

* – Limit of detection reported greater than most stringent applicable standard, generally in an undiluted sample (i.e., lowest achievable limit); “non-detect” concentration not taken as exceedance per NR 720.07(2)(d)(1)

(J) – Concentration reported by the laboratory above the Limit of Detection, but below the Limit of Quantification

NL – Not Listed

VOCs via USEPA Method SW8260B/5035
