BRRTS No. 02-68-581237
VPLE No. 06-68-582959
FID No. 268414850

Dear Mr. Alessi:

GZA GeoEnvironmental, Inc. (GZA), on behalf of Leather-Rich Inc. (LRI/“Client”), is pleased to submit this Supplemental Site Investigation Work Plan (“Work Plan”) for the LRI facility located at 1250 Corporate Center Drive in the City of Oconomowoc, Wisconsin (“Site”). The scope of work presented herein is based on the March 3, 2020 Interim Remedial Action Work Plan - Review and Comments letter (“WDNR Letter”) provided by the Wisconsin Department of Natural Resources (WDNR) in response to GZA’s November 21 [sic - November 25], 2019 *Interim Remedial Action Work Plan*.¹ A telephone discussion of the WDNR Letter was convened on March 13, 2020, with representatives of LRI, GZA, and Axley Brynelson, LLP law firm. Further, the proposed scope of work presented herein was discussed with you and Ms. Cheryl Chew of LRI, on July 8, 2020.

The supplemental investigation activities proposed by GZA are intended to satisfy the requirements of Chapter NR 716 of the Wisconsin Administrative Code (Wis. Adm. Code) so that a comprehensive Site Investigation Report and Remedial Action Plan can be submitted to the WDNR.

SITE INFORMATION

The Site is located at the address of 1250 Corporate Center Drive within the City of Oconomowoc, within the northeast ¼, of the northwest ¼ of United States Public Land Survey Section No. 15, Township 7 North, Range 17 East, Waukesha County, Wisconsin. A Site Location Map is provided as Figure 1.

¹ *Interim Remedial Action Work Plan, Leather-Rich, Inc., 1250 Corporate Center Drive, Oconomowoc, Wisconsin, BRRTS No. 02-68-581237 and 06-68-582959*, dated November 21, 2019, GZA File No. 20.0156045.00.

Site Contact Information

BACKGROUND

The Site is located on an approximately 4-acre parcel within a commercial business park in the City of Oconomowoc, Wisconsin. The LRI building covers an area of approximately 40,000 square feet and is situated along the southern property boundary. A parking lot is located west of the building adjacent to Executive Drive, a parking lot and grass area are located on the east side of the building along Corporate Center Drive, and a grass area is located north of the building. The surrounding properties are occupied by commercial businesses. Figure 2 is a Site Plan that shows the Site layout and features.

Building Layout and Operations

The internal layout of the LRI building is presented on Figure 3. The operations manager office space is the only office space that faces the work area and is occupied minimally throughout the work week for an average of 20 hours. Other office space is located in the southeast corner of the building and upgradient of the containment area.

Spray booths are located in a spray room where water-based dyes are used and stored. According to the Safety Data Sheet (SDS) for these dyes, they are considered non-hazardous. The spray room is an area where garments are treated with dyes and leather treatment chemicals. The leather dyes used in the spray room consist of water-based mixtures. Based on the information provided by LRI for the chemical products used in the spray room, the spray room is not considered to be a potential source area of concern due to the limited quantity of products used in this area.

There are two currently in-use “fur vaults,” which are temperature- and humidity-controlled rooms used to preserve the integrity of garments. In a third former “fur fault,” rug cleaning is performed using conventional detergents, water, and a steam gun. Lastly, the facility uses industrial-grade ozone generators in a controlled “ozone room,” which is used to remove smoke and other odors from garments. This area is also used for garment repair in the center and pillow ticking to the west.

The shed located outside of the north exterior wall within the fenced area is approximately 12 feet by 9 feet and is used to store the lawnmower, trimmer, and small fuel containers. No other chemical storage has been conducted within the shed.

System Upgrades and Preventative Measures

The dry cleaning operations originally consisted of eight dry cleaning machines that were installed in 1993, which were mounted on a 4-inch concrete slab on top of the floor slab. Between 2016 and 2017, six of the machines were removed from service; two machines remain today. The reduction in the number of machines and the resulting reduction in the

amount of tetrachloroethene (PCE) used has reduced and/or prevented potential discharges. Additionally, the existing machines are inspected weekly for maintenance and whether any leaks have occurred. The PCE filtration unit is also inspected daily for maintenance issues or leaks. The dry cleaning machines represent a closed loop system and the PCE used in the dry cleaning operation is recovered and treated for re-use. PCE is delivered to the Site via the overhead doors located west of the process area and is wheeled to a PCE storage tank in the process area, which is located in the containment area along the north wall, behind the machine and process area. Waste sludge from dry cleaning operations is stored in 55-gallon drums on a concrete surface northeast of the dry cleaning machines within the containment area, which are transported and disposed off-Site approximately three times per year.

Potential PFAS-Containing Products

The WDNR has requested clarification on the use of Scotchgard™ at the Site. LRI did not use the brand name Scotchgard™ as a water propellant, but the website for LRI does reference Scotchgard™ for customer recognition and understanding. LRI has used another water repel product, Water Repel #2, which does not contain per- and polyfluoroalkyl substances (PFAS). The annual volume of Water Repel #2 purchased by LRI is between 2 and 3 gallons; the actual use of the product is less, as LFI also sold small containers for customer use. The Water Repel #2 is applied by a spray gun within a spray booth. The spray booth has thick filters to trap overspray, which are changed regularly and inspected weekly. Additionally, there is an exhaust system that exits through the roof. The Water Repel #2 and the dye chemicals are stored on a shelving area of the spray room.

No PFAS-containing material product has been used in the carpet cleaning operations. Carpet cleaning operations utilize soap and water only.

Off-Site Receptors and Utilities

The delivery and unloading area on the north side of the LRI building has a trench floor drain, which drains to the municipal sanitary sewer system. Wastewater from the rug cleaning process, which uses conventional detergents, is discharged into this drain. A floor drain in the garage area/pillow ticking area by the overhead door discharges to the storm sewer. The conventional laundry and emergency shower areas also have trench drains, but these connect directly to the sanitary sewer utility.

The storm sewer and electrical utility easement for the development are located south of the LRI property. Water and sanitary sewer enter the east wall of the building from Corporate Center Drive. The internal water lines within the building were constructed overhead; the only subsurface utilities in the building are storm and sanitary sewer. Electrical utility enters the building from the south side of the property. The utility layout and drains are presented on Figure 2.

The closest downgradient potable wells are located approximately 1,600 to 2,100 feet northwest of the facility. The two potable wells each serve a single household. The well records are presented in Attachment 1. The closest downgradient building is located northwest of the Site approximately 400 feet and is currently occupied by Hein Electric Supply Company (Hein Electric). Hein Electric is provided municipal water by the City of Oconomowoc.

Indoor Air Sampling Status

Indoor air sampling was requested in the WDNR Letter. Based on the ongoing activities at the Site where PCE is regularly used for dry cleaning, indoor air samples likely will confirm the presence of PCE in vapors from Site use rather than vapor partitioning and migration from the subsurface. It is requested, therefore, that the indoor air sampling activities are delayed until the dry cleaning operations are no longer active and the soil vapor extraction (SVE) system is operational. As you know, the SVE pilot test was completed in 2019.

Figure 3 presents the layout of the building, which shows that no offices are near the locations of the vapor probes that were installed in 2018. The actual office areas are located upgradient of the containment area and it is unlikely that preferential pathways exist for vapors to migrate into the spaces, as no sub-slab utilities traverse the building from the containment area to the office space. As indicated above, we suggest that the sub-slab samples not be collected until the proposed SVE system is operational to address the elevated concentrations of PCE in the soil.

PROPOSED SCOPE OF WORK

Based on the background information presented above and our prior discussions, GZA has prepared this scope of work to conduct supplemental Site investigation activities in accordance with Chapter NR716 of the Wis. Adm. Code. The scope of work developed by GZA is presented below, but is subject to change based on the results of the field conditions and the results of analytical testing on the collected soil and groundwater samples.

Off-Site Investigation

- Advancement of two soil borings off-Site on the northwest property occupied by Hein Electric.

The two borings will be converted to NR 141 monitoring wells to delineate PCE, trichloroethylene (TCE), and PFAS. As previously discussed with you, Ms. Fassbender, and Ms. Chew, concentrations of chlorinated hydrocarbons and PFAS were previously detected in groundwater samples collected near the downgradient property line in monitoring well MW-17. The results of the analytical testing performed on the downgradient monitoring wells is presented in Tables 1 (VOCs) and 2 (PFAS) and shown on Figure 4 for VOCs, and laboratory analytical reports for the PFAS samples are provided in Attachment 2. The locations of the proposed monitoring wells are shown on Figure 2.

- Collection of one soil sample from each boring from the capillary fringe within the soil column, anticipated to be at 12 to 16 feet below ground surface (bgs), for submittal to a laboratory for VOC analyses.

Soil samples will be collected by placing soil into laboratory-supplied sample containers, placing the samples on ice in an insulated cooler, and shipping the samples under standard chain-of-custody protocol to a subcontracted analytical laboratory. The soil samples will be analyzed for VOCs.

Prior to commencement of subsurface activities, public utilities will be marked by Digger's Hotline, the public utility locating service in Wisconsin.

Each boring will be advanced using track-mounted Geoprobe® drilling equipment. During boring advancement, soils will be field-screened and visually described in 2-foot sampling intervals from the ground surface to the terminus of each boring, which is estimated to be approximately 20 feet bgs. The soil lithology and other observations will be recorded on the boring logs and in the field notebook.

During visual soil description, a portion of the soil sample from each 2-foot interval will be placed in a sealed, plastic bag and allowed to equilibrate prior to field screening for total VOCs using a photoionization detector (PID) equipped with a 10.6 eV lamp. The samples recovered will also be visually inspected for indication of potential impairment and classified in accordance with the Unified Soil Classification System (USCS). Field observations, including PID results, will be recorded on a soil boring log for each boring.

Following soil sampling, each of the monitoring wells will be installed as Wis. Adm. Code Chapter NR 141-compliant flush-mount wells. The wells will be installed using a hollow-stem auger to a depth of 20 feet bgs and will be constructed with 2-inch PVC riser pipe consisting of 10 feet of 0.010-inch screen with 10 feet of riser. The wells will be developed following installation to remove fines from the groundwater and sand pack around the screen. Following the installation of the wells, each location will be allowed to accumulate water over a 24-hour period and will subsequently be purged and

developed. Field documentation forms to be completed during the investigation include soil boring logs, monitoring well construction forms, well development forms and laboratory chain-of-custody documentation.

Groundwater samples will be collected from each well location, along with the monitoring well network, using low flow methods and a peristaltic pump equipped with dedicated disposable tubing. GZA will use standard industry methods to collect groundwater samples that are as sediment-free as possible. The groundwater samples will be placed into laboratory-supplied sample containers, placed on ice in an insulated cooler, and shipped under chain-of-custody protocol to a Wisconsin-certified laboratory. The groundwater samples will be analyzed for VOCs by United States Environmental Protection Agency (USEPA) Method 8260. Groundwater samples from the off-Site wells will also be analyzed for PFAS by USEPA Method 537 Modified.

Vertical Aquifer Profiling

Advancement of two soil borings for completion of vertical aquifer profiling (VAP) at the following locations:

- One VAP boring at the location of PZ-3 to delineate the plume vertically and to guide the appropriate depth or depths to set the piezometer.
- One VAP boring near the location of the contaminant source to define the plume vertically. The location of the second VAP will be between existing monitoring wells MW-6 and MW-7.

The locations of the VAP borings are shown on Figure 2. The VAP borings will be installed using a direct-push Geoprobe® to a depth of 50 feet bgs. Based on the previous subsurface activities, it is anticipated that groundwater will be encountered between 12 and 16 feet bgs.

Once groundwater is encountered, each 10-foot interval to a depth of 50 feet will be screened and a groundwater sample will be collected. Due to the homogenous nature of the sand and gravel at the Site, intervals of less than 10 feet will not be required for sampling. The samples will be collected at each sampling interval via low-flow sampling techniques to monitor the groundwater zone conditions, and upon stabilization of the parameters, the samples will be collected into laboratory-supplied jars for VOC analyses. The results of the VAP sampling will determine the potential need and depth of any additional piezometers and will provide a more in-depth understanding of the fate and transport of dissolved PCE at the Site. Following the drilling and sampling activities at the Site, GZA will coordinate the pick-up and disposal of the investigation-derived waste soil and groundwater.

Monitoring Well Network Sampling

The monitoring well network, consisting of 17 monitoring wells and three piezometers, will be sampled for VOCs utilizing low-flow sampling. The sampling activities will be conducted using low-flow methods and a peristaltic pump equipped with dedicated disposable tubing. GZA will use standard industry methods to collect groundwater samples that are as sediment-free as possible. The groundwater samples will be placed into laboratory-supplied sample containers, placed on ice in an insulated cooler, and shipped under chain-of-custody protocol to a Wisconsin-certified laboratory. The groundwater samples will be analyzed for VOCs by USEPA Method 8260.

Prior to well sampling activities, each monitoring well will be gauged for depth to water. The monitoring well network, including the two newly installed wells, will be re-surveyed to a known datum to evaluate the groundwater flow patterns.

Site Investigation Reporting

The soil and groundwater laboratory VOC data are anticipated within two to four weeks of submittal of the samples to the laboratory. The laboratory data for PFAS will require additional time following submittal to the laboratory. GZA will

review and evaluate the data and prepare a Site Investigation Addendum Report documenting our observations from the field and the results of soil and groundwater laboratory testing as compared to applicable regulatory standards in Chapters NR 140 and NR 700 of the Wis. Adm. Code. A draft of the Site Investigation Addendum Report will be prepared for review by the Client prior to submittal to the WDNR.

CONCLUSIONS

As a small business that is actively interested in moving forward with the Site remedial work in support of a real estate transaction, LRI is requesting that the in-situ remedial efforts for addressing PCE in groundwater be conducted following completion of the supplemental investigation activities presented herein. In recent conversations between LRI, GZA, and the WDNR, concern on the part of the WDNR was voiced that the PFAS investigation and sampling were necessary to be completed before approval would be granted for the remediation of chlorinated hydrocarbons dissolved in groundwater. As the concentration of the PFAS and PCE in groundwater at the Site are relatively low, and if the off-Site investigation and sampling provide favorable data with the respect to PFAS, LRI would like the WDNR's concurrence that the groundwater remediation, which was outlined in the *Interim Remedial Work Plan* dated November 21, 2019, be conducted.

Should you have any questions regarding the information contained herein, please feel free to contact us at your convenience.

Very truly yours,

Notes:

1. Samples were collected by GZA GeoEnvironmental, Inc. (GZA) and analyzed by PACE Analytical Lab, Inc. (PACE) of Green Bay, Wisconsin using WI GRO for GROs and USEPA Method 8260 for Volatile Organic Compounds
2. Results are presented in micrograms per liter ($\mu\text{g/l}$).
3. Results are compared to Wisconsin Administrative Code (WAC) Chapter NR 140 Enforcement Standards (ESs) and Preventive Action Limits (PALs).
4. **Underlined Bold Red font** indicates the parameter was detected above the ES and **Bold italicized font** indicates the parameter was detected above the PAL.
5. "—" = The sample was not analyzed for the specified parameter.
6. Only results for compounds detected during laboratory analyses are presented.
7. J = Estimated value. The analyte was detected at a concentration between the limit of detection (LOD) and limit of quantification (LOQ).
8. "NA" = Not Analyzed
9. "NS" = No Standard available under WAC NR 140.

Notes:

1. Groundwater samples were analyzed by Pace Analytical of Green Bay, Wisconsin by USEPA Method 537 Modified
2. Analytical results are presented in nanograms per liter (ng/l); equivalent to parts per trillion (ppt).
3. Results for compounds that were analyzed by the laboratory presented.
4. Wisconsin Administrative Code (WAC) Chapter NR 140 Enforcement Standards (ES) and Preventive Action Limits (PAL) provided are based on the June 2019 provisional standards.
5. Underlined font indicates a concentration in exceedance of a PAL. **Bold red** font indicates a concentration in exceedance of an ES.
6. < = Analytes were not present at concentrations above the laboratory detection limit.
7. NS - No Standard
- 8.0 'D' - Result obtained from analysis of diluted sample

Brookfield, WI 53045

RE: Project: 20.0156400 LEATHER RICH GW
Pace Project No.: 40201900

Dear Heidi Woelfel:

Enclosed are the analytical results for sample(s) received by the laboratory on January 13, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Christopher Hyska

QUALIFIERS

Project: 20.0156400 LEATHER RICH GW
Pace Project No.: 40201900

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor, percent moisture, initial weight and final volume.

LOQ - Limit of Quantitation adjusted for dilution factor, percent moisture, initial weight and final volume.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-G Pace Analytical Services - Green Bay

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

pH Post-analysis pH measurement indicates insufficient VOA sample preservation.

RE: Project: 20.0156045.01 LEATHER RICH
Pace Project No.: 40203824

Dear Heidi Woelfel:

Enclosed are the analytical results for sample(s) received by the laboratory on February 26, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Christopher Hyska

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

Page 6 of 22

Page 1 of 17

DISCUSSION

This report presents the results from the analyses performed on three samples one duplicate and a matrix spike submitted by a representative of Pace Wisconsin. The samples were analyzed for twenty-one perfluorinated compounds using a modified version of USEPA Method 537. Reporting limits were set to the quantitation limits.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank was free of the target perfluorinated compounds at the reporting limits. This indicates that the sample processing procedures did not significantly contribute to the analyte content determined for the sample material.

Laboratory spike samples were also prepared with the sample batch using clean reference matrix that had been fortified with native standards. The recovery results were within the method limits. The RPDs (relative percent differences) between one designated spike and its duplicate were within the method limits. These spikes indicate that extraction performed as expected.

On the matrix spike there are several analytes that are marked "R" as the recoveries are diminished from the expected levels. These deviations may be due to the presence of the affected analytes in the sample material and/or sample inhomogeneity.

Recoveries for most of the isotopically-labeled surrogate standards in the sample extracts were within the target ranges specified in the method. The 40203824001-MS samples had recoveries for the surrogate labeled d5-EtFOSAA that was lower than the method limit (flagged "Fail"). Where surrogates failed, the sample results could be biased in the same direction.

Results for the low level spikes that were below the calibration range were flagged "J".
