WDNR FID # 241311510

Dear Ms. Meyer,

Please find attached the *Vapor Mitigation System Operation and Maintenance Report* (Report) for the subject site.

This Report is being submitted via WDNR's online RR Program Submittal Portal. Pursuant to WDNR's current submittal policy, a hard copy of the Report is not being submitted.

Please feel free to contact me at your convenience at (414) 587-4467 (cell) or via email at frank.dombrowski@wecenergygroup.com if you have any questions.

Sincerely,

Frank Dombrowski
Principal Environmental Consultant

Subject: **Vapor Mitigation System Operation and Maintenance Report**
Metro North Service Center
3100 West North Avenue
Milwaukee, Wisconsin 53208
WDNR BRRTS # 02-41-583015
WDNR FID # 241311510

Dear Ms. Meyer,

This *Vapor Mitigation System Operation and Maintenance Report* (“Report”) was prepared by Geosyntec Consultants (Geosyntec) on behalf of Wisconsin Electric Power Company (d.b.a, We Energies) for Metro North Service Center (MNSC) located at 3100 West North Avenue, Milwaukee, Wisconsin 53208 (Site).

This Report is being submitted to the Wisconsin Department of Natural Resources (WDNR) pursuant to the June 23, 2023 *Vapor Mitigation System Construction Documentation Report and Operation and Maintenance Plan* and in general accordance with NR 724.13(3) of the Wisconsin Administrative Code. The NR 712.09 submittal certification is provided in **Attachment 1**.

This Report includes salient background information and documents October 2023 vapor mitigation system (VMS) inspection and testing [pressure field extension (PFE) testing and indoor air sampling], maintenance and emissions sampling.

1. BACKGROUND

The Site VMS is an active submembrane depressurization system (SSDS) installed during the reconstruction of the southwest portion of the Site building in 2021. The VMS was commissioned in 2022 and 2023. The VMS mitigates the vapor intrusion pathway at the Site related to post-source

remedial action¹ residual soil and groundwater impacts. Tetrachloroethene (PCE) is the primary Site contaminant.

The VMS location is depicted on **Figure 1 (Attachment 2)**. The VMS generally includes a submembrane venting system [venting layer (6-inch coarse granular layer with incorporated GEOVENT™ conveyance units) with three (3) riser pipes, blowers, and exhaust stacks], a barrier layer (20-mil polyethylene geomembrane overlain by a minimum 60-mil LIQUID BOOT® spray-applied barrier) above the venting layer, and five (5) sub-slab vapor probes. The VMS layout is depicted on **Figure 2 (Attachment 2)**.

The construction, as-built conditions and commissioning of the VMS are documented in the June 23, 2023 *Vapor Mitigation System Construction Documentation Report and Operation and Maintenance Plan*.

2. INSPECTION AND TESTING

VMS inspection, pressure field extension (PFE) testing and indoor air sampling were conducted on October 5, 2023 in accordance with the June 23, 2023 *Vapor Mitigation System Construction Documentation Report and Operation and Maintenance Plan*.

Inspection

The VMS inspection is documented on the Vapor Mitigation System Inspection Log (WDNR Form 4400-321) provided in **Attachment 3**. The primary inspection components and inspection findings are summarized in the following table:

Inspection Component	Inspection Finding
Each blower is operational	✓
Each blower vacuum and air flow are consistent with operational baseline conditions	✓
Blower housing and roof mounts are in good condition	✓
Blower is secure to roof	✓ (see Note 1)
Blower does not exhibit excessive vibration	✓
Blower stack is clear of any obstructions	✓
Each riser pipe pressure gauge is operational	✓
Each blower alarm is operational	✓
Vapor probes and vapor probe seals/covers are in good condition	✓
<i>Note:</i> (1) The blowers were observed to be secure to the roof; however, the sandbags providing supplemental stability were observed to be in poor condition.	

¹ Source area unsaturated soil and shallow groundwater remedial action was completed in 2021, including the removal of approximately 4,630 tons of PCE-impacted soil. Source area remedial action is documented in the June 23, 2023 *Source Area Remedial Action Construction Documentation Report*.

PFE Testing

The PFE testing was conducted at the five (5) vapor probes (VP-1 to VP-5) depicted on **Figure 2** using a TEC DG-8 Digital Pressure Gauge with an accuracy of 0.001 inch-H₂O. The PFE testing results are provided in **Table 1 (Attachment 4)**. Previous startup and commissioning PFE testing data are also included in **Table 1**.

The PFE testing results indicate that the target differential negative pressure of at least 0.004 inch-H₂O was achieved at each vapor probe.

Indoor and Ambient Air Sampling

Six (6) indoor air samples (IA-01 to IA-06) and one (1) ambient (outdoor) air sample (OA-07) were collected. The indoor air samples were collected at consistent locations as previous sampling events. The ambient air sample location was based on wind direction (placed on upwind side of building). The approximate sample locations are depicted on **Figure 3 (Attachment 2)**.

The air samples were collected over an 8-hour period using 6-liter Summa® canisters with laboratory-supplied flow controllers (to provide an 8-hour time-weighted average concentration). The Summa® canisters were deployed approximately 3 to 5 feet above the floor/ground surface. One (1) duplicate indoor air sample was collected.

The samples were submitted to Pace Analytical under standard chain-of-custody protocols for laboratory analysis of PCE and PCE degradation products [trichloroethene (TCE), cis- and trans-1,2-dichloroethene (DCE), and vinyl chloride] by EPA-Method TO-15. One (1) duplicate sample was collected.

The air sampling results are summarized in **Table 2 (Attachment 3)** and the laboratory report is provided in **Attachment 5**.

PCE was detected in each indoor air sample at concentrations ranging from 2.23 to 5.72 micrograms per cubic meter (ug/m³). These results are at two (2) orders of magnitude less than the WDNR commercial/industrial indoor air Vapor Action Level (VAL) of 180 ug/m³. TCE was detected in one (1) indoor air sample (IA-02) at a concentration of 8.04 ug/m³ which is less than the WDNR indoor air VAL of 8.8 ug/m³. Cis-1,2-DCE, trans-1,2-DCE and vinyl chloride were not detected in any of the indoor air samples. PCE and PCE degradation products were not detected in the ambient (outdoor) air sample.

3. MAINTENANCE

VMS maintenance was limited to replacing the materials providing supplemental stability to the roof-mounted blowers. Sandbags were replaced by concrete blocks on October 6, 2023 as depicted on the photographs in **Attachment 6**.

4. EMISSIONS SAMPLING

VMS emissions samples were collected from each extraction point (EP-1, EP-2 and EP-3) on October 5, 2023 to assess the need for emissions inventory reporting to the WDNR. Annual emissions inventory reporting is required for facilities that emit an air contaminant in quantities greater than NR 438 Reporting Levels (RLs).

The samples were collected with 1-liter Summa[®] canisters connected to the sampling port on each riser pipe. During sampling, the air flow velocity and vacuum were measured. The air flow velocity was measured using a Dwyer Model 471B Digital Thermo Anemometer at the measurement port installed on each riser pipe. Vacuum was measured by the differential pressure gauge mounted on each riser pipe.

The samples were submitted to Pace Analytical under standard chain-of-custody protocols for laboratory analysis of volatile organic compounds (VOCs) by EPA-Method TO-15. The laboratory report is provided in **Attachment 7**.

Table 3 (Attachment 4) provides an emissions data evaluation summary including the detected VOCs, detected concentrations, measured flow velocity, measured vacuum, calculated volumetric flow rate and calculated mass flux (emissions) for each riser pipe; the calculated total VMS emissions VMS (EP-1 + EP-2 + EP-3) for the detected VOCs; and the NR 438 RLs for the detected VOCs.

As documented in **Table 3**, the calculated total VMS emissions for each detected VOC was at least two (2) orders of magnitude less than NR 438 RLs. The calculated emissions for the primary Site contaminant (PCE) of 2.4 pounds per year (lb/yr) was two (2) orders of magnitude less than the NR 438 PCE RL of 151 lb/yr.

Based on the above evaluation, 2023 emissions inventory reporting to WDNR is not required for the Site VMS. In accordance with NR 438.03(4), emissions records will be retained for a minimum of 5 years.

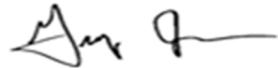

Ms. Jennifer Meyer

Vapor Mitigation System Operation and Maintenance Report
Metro North Service Center
3100 West North Avenue
Milwaukee, Wisconsin
WDNR BRRTS # 02-41-583015
WDNR FID # 241311510

Notice: In accordance with s. NR 727.05 (1) (b) 3., Wis. Adm. Code, use of this form for documenting the inspections and maintenance of certain vapor-related continuing obligations is required. Personal information collected will be used for administrative purposes and may be provided to requesters to the extent required by Wisconsin's Public Records Law [ss. 19.31-19.39, Wis. Stats.].

Directions: This form was developed to provide the results of a site inspection of a vapor related continuing obligation, typically a vapor mitigation system. See the closure approval letter for this site for requirements regarding the submittal of this form to the Department of Natural Resources. A copy of this inspection log is required to be maintained either on the property, or at a location specified in the closure approval letter. The closure letter may be found in the database, [BRRTS on the Web](#), by searching for the site using the BRRTS ID number, and then looking in the "Action" section, for code 56.

Activity (Site) Name: Metro North Service Center

BRRTS No. 02-41-583015

Date of Inspection: 10/05/2023

When submittal of this form is required, submit an electronic version or a scanned copy of this completed form to the [RR Submittal Portal](#).

HOW TO USE THIS FORM

The Activity (Site) Name, BRRTS No. and Date of Inspection entered below will auto-populate the table. Complete only the applicable rows/components. Check "Not Applicable" for components that do not apply. For example, if there is no sump sealed and vented as part of the system, check "Not Applicable" in the "NOTES" section for that component.

Multiple components: For systems with multiple components (e.g., two manometers or two fans), add an additional row for that component by clicking the "+" (plus) symbol at the end of the row. After a system component row is added, a "-" (minus) symbol is shown so the added row may be deleted.

Photos: Click on the placeholder photo shown in each row to replace it with your own site-specific photo. Site-specific photos are optional but strongly recommended. Enter specific details and observations within the "NOTES" section to assist the DNR in understanding status of the system components.

SYSTEM COMPONENT	NAME	WHAT DOES IT DO?	WHAT DO I CHECK?	WHAT SHOULD I SEE?	DATE:

Manometer or Differential Pressure Gauge		Measures differential pressure between vacuum side of vent pipe and indoor space. This measurement confirms there is a vacuum being pulled by the fan.	Liquid Level on Manometer or Gauge	Liquid level in manometer should be offset (not level with each other).	A change in liquid level indicates a change in the vacuum below foundation. This could be caused by failure of fan, blockage of vent pipe, change in water level below building, or other conditions. Hire a professional to identify cause and repair if needed.
PHOTO					NOTES: (Record the reading on the gauge. Identify specific building and location description: <input type="checkbox"/> Not Applicable EP-1: flow 1276 ft/min, vacuum -7.8 in-H2O EP-2: flow 1381 ft/min, vacuum -7.8 in-H2O EP-3: flow 1260 ft/min, vacuum -8.8 in-H2O

					WHAT TO FIX?	
Fan		Fan creates a vacuum and lowers pressure below foundation. The fan also removes soil gases from below foundation for discharge to atmosphere.	Fan Operation Fan Location Motor Noise	Fan is on. Fan mounted outside & secure. Fan motor is quiet (loud motor may indicate problem).	Replace the fan immediately once the fan stops running. Fans typically run for 10-20 years, but it may be less. Replacement fan to have similar specifications as original with respect to flow and vacuum. After a fan is replaced, the system should be evaluated by a mitigation professional to verify effectiveness, which includes pressure readings. Original Fan Make and Model:Obar GBR76 SOE (16" WC @ Max Flow 155 CFM)	[+]
PHOTO		 <p>NOTES: (Identify specific building and location description:)</p> <p><input type="checkbox"/> Not Applicable</p> <ul style="list-style-type: none"> - all blowers were operational (EP-1, EP-2 and EP-3) - each blower vacuum and air flow are consistent with operational baseline conditions - blower housing and roof mounts are in good condition - blower is secure to roof; the sandbags providing supplemental stability were observed to be in poor condition; therefore, sandbags were replaced by concrete blocks on October 6, 2023 - blowers do not exhibit excessive vibration

WDNR Indoor Air VAL				180	8.8	180	180	28

Notes:

bold - reported concentration exceeds the WDNR Indoor Air VAL

J - Estimated concentration at or above the limit of detection and below the limit of quantitation.

ug/m³ - micrograms per cubic meter

VAL - WDNR vapor action level (large commercial/industrial)

VOCs - volatile organic compounds

WDNR - Wisconsin Department of Natural Resources

TABLE 3
Vapor Mitigation System O&M - Emissions Sampling Data and Calculations Summary
 Metro North Service Center (MNSC)
 3100 West North Avenue, Milwaukee, Wisconsin

Sample Collection Date	10/5/2023	
Sample Method	TO-15	
Sample Numbers	EP-01-102023, EP-02-102023, EP-03-102023	
Number of Emissions Stacks	3 (EP-1, EP-2 and EP-3)	
Approximate Height of Emissions Stacks	22 ft above ground, 10 ft above roof	
Primary Vapor Contaminant	Tetrachloroethene (PCE)	

EP-1, 2 and 3		EP-1 Emissions					EP-2 Emissions					EP-3 Emissions					Total Emissions = EP-1 + EP-2 + EP-3			NR 438 Reporting Level			
Pipe Diameter	Area of Pipe (1)	Flow Velocity	Vacuum	Flow Rate (2)	Detected Analytes (VOCs)	Conc.	Mass Flux (3)	Flow Velocity	Vacuum	Flow Rate (2)	Detected Analytes (VOCs)	Conc. Notes:

(1) Area of Pipe (ft²) = pipe radius²*Pi

(2) Flow Rate (scfm) = measured Flow Velocity (ft/min) x Area of Pipe (ft²) x [(standard pressure - measured pipe vacuum)/standard pressure]

(3) Mass Flux (lb/hr) = Flow Rate (scfm) x concentration (ug/m³) x 0.0283 m³/ft³ x 60 min/hr x 1 lb/453,592,370 ug

-- - not established

conc. - concentration

ft - feet

ft/min - feet per minute

in-H₂O = inches of water

lb/hr - pounds per hour

lb/yr - pounds per year

ND - not detected

r - radius of pipe

scfm - standard cubic feet per minute

standard pressure - 406.78 in-H₂O

ug/m³ - micrograms per cubic meter

VOCs - volatile organic compounds

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ Al
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.

Entire Report Reviewed By:

Jennifer A McCurdy
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ Al
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
