## Executive Summary

### DCRA Storm Water Monitoring Results to Incorporate Mitigation and Investigation Planning

The objectives of the storm water sampling efforts documented in this report are to (1) measure per- or poly-fluorinated alkyl substances (PFAS) contributions within drainage basins and sub-basins of the Airport's storm sewer system; (2) identify priority sub-basins for action to reduce PFAS in storm water discharges; and (3) establish a basis of knowledge to drive further investigations and remediation activities.

Consistent with the storm water sampling work plan that had been reviewed and approved by the Wisconsin Department of Natural Resources (WDNR), water samples were collected from twenty-three (23) drainage basin outfalls and eighteen (18) junctions within the major drainage basin network. The sample locations are shown in the **Stormwater Sampling Summary for Dane County Regional Airport BRRT # 02-13-584472** (May 2020).

The water samples were analyzed using United States Environmental Protection Agency (US EPA) Method 537 (Modified) for 24 PFAS compounds. Field blanks and duplicates were also collected and analyzed to support data validation. These samples were collected on February 10 – 12, 2020 under dry weather winter conditions.

The sample results and laboratory reports are provided in the May 2020 Stormwater Sampling Summary. Key observations for perfluorooctanoic acid (PFOA) and perfluorooctanoic sulfonate (PFOS), the two PFAS compounds of concern are as follows:

- Combined PFOA+PFOS concentrations were detected between 0 and 70 part per trillion (ppt), US EPA's current Lifetime Health Advisory level for drinking water, at twenty-three (23) locations. Eleven (11) locations had combined concentrations exceeding 70 ppt. The highest concentrations were detected at Outfalls 021, 027, and 032.
- PFAS was found in sub-basins associated with Wisconsin Air National Guard (WANG) Base operations and in some unexpected outfalls/locations. The sources of some of these observed concentrations are not clear.
- The results may reflect the influence of factors at each location at the time of sampling such as low or no flow, sediments, foam, and backwater effects from the receiving waters.
- Two outfalls stand out relative to elevated PFAS concentrations:
  - Outfall 021 and associated drainage junction sampling locations includes WANG base. Sampling results from Outfall 021 network locations suggest a PFAS source close to the outfall.

- Outfall 032 and associated drainage junction sample locations include parts of the WANG base. Sampling results from Outfall 032 network locations show a lot of variability in PFAS concentrations.

Estimated mass loads at each outfall were calculated using the combined PFOS and PFOA concentrations multiplied by the flow rate. The resulting loads reflect the mass of PFOS+PFOA discharged at each outfall during dry weather flow conditions. Ninety-four percent (94%) of the total PFOS and PFOA load discharged from the airport outfalls during the sampling event was from Outfalls 021 and 032.

Preliminary conclusions point to priority “hot spots” for action in the Outfall 021 and Outfall 032 drainage basins to address the largest sources of PFAS discharges. Many unknowns remain regarding PFAS sources, fate, and transport in other drainage basins, and additional investigation will be required to locate PFAS sources and determine mitigation strategies in those basins.

Based on these results, the Airport is currently planning to pursue the following next steps:

- Further investigations to address unknowns regarding sources as well as fate and transport which may include but are not limited to:
  - Wet weather sampling
  - Additional dry weather and other sampling
  - Evaluating past practices on-airport that may be sources of PFAS
- Mitigation efforts will be initiated in the priority sub-basins to reduce PFAS discharges to the environment:
  - 1) “BAM” booms surface water treatment technology will be installed at Outfall 021 as a pilot study. Monitoring will be conducted to evaluate the performance of the technology.
  - 2) Targeted pipe segments within the Outfall 021 and Outfall 032 storm sewer networks will be televised to identify locations of groundwater infiltration and/or sediment deposits. The effectiveness of slip-lining of leaking and damaged storm sewers in reducing PFAS infiltration into storm sewers will be evaluated. Identified sediment deposits will need to be tested for PFAS before removal and disposal prior to slip-lining. As appropriate/feasible, sections of storm sewer will then be slip-lined to stop infiltration of PFAS-impacted groundwater.
- The Airport, following a Request for Proposals (RFP) from the County, will be hiring a PFAS remediation contractor to lead the site response. Mead & Hunt will continue to lead the site work until a final decision is made, including leading further investigation and mitigation efforts.

### **Proposed Storm Water Investigation Timeline**

**May 2020**

This document provides a summary of stormwater sampling information collected at the Dane County Regional Airport (DCRA) during a February 10-12, 2020 event. Sampling was conducted in response to BRRTS # 02-13-584472, to provide initial information on per- and polyfluorinated alkyl substance (PFAS) constituents in stormwater at the airport. Sampling procedures and locations were described in the Initial Site Investigation Work Plan (February 4, 2020 (revised)) that was submitted to the WDNR on February 18, 2020.

#### *Climatologic Conditions*

The National Weather Service (NWS) reported 6 inches of snow at DCRA on February 6, adding to an existing snowpack of approximately 5 inches. The average temperature during the sampling period was 32 degrees and NWS reported that the snow depth decreased from 10 inches to 9 inches during the sampling period. Low runoff rates were observed during the sampling period. **Table 1** contains a summary of climatologic information reported by NWS immediately prior to and during the sampling period.

The mass loading of PFOA + PFOS was calculated for each outfall sampled. The mass loading is calculated by multiplying the combined PFOA + PFOS concentration by the flow rate. The mass loading calculated at each outfall is shown in **Table 5**. On the following page, **Figure 5** shows the calculated PFOA + PFOS mass load for the outfall locations sampled.

### MS Semi-volatiles By Method EPA 537M BY ID

**Matrix:** AQ

**Batch ID:** OP79063

All samples were extracted within the recommended method holding time.

All samples were analyzed within the recommended method holding time.

Sample(s) FA72576-1MS, FA72576-3DUP were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

Matrix Spike Recovery(s) for Perfluorooctanesulfonic acid are outside control limits. Probable cause is due to matrix interference.

RPD(s) for Duplicate for 6:2 Fluorotelomer sulfonate, Perfluorononanoic acid are outside control limits for sample OP79063-DUP. Probable cause is due to sample non-homogeneity.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above.
