# 2021 Annual Progress Report

*Former Amoco Terminal*

*2904 Winter Street, Superior, Wisconsin*

## 1.0 INTRODUCTION AND SCOPE OF WORK

Antea®Group is submitting this progress report documenting work conducted from January 1 to December 31, 2021 at the Former Amoco Terminal in Superior, Wisconsin. The Former Amoco Terminal is comprised of two investigation areas and three open Bureau for Remediation and Redevelopment Tracking System (BRRTS) numbers, the Terminal (BRRTS #02-16-000331) and the Barge Dock (BRRTS #02-16-117873 and BRRTS #02-16-297979).

The work conducted from April through October 2021 included:

- **Groundwater Monitoring**
  - 118 wells were gauged in May 2021 and semi-annual groundwater sampling was conducted in May and October 2021 for 18 wells. Groundwater samples, two duplicates and one trip blank were submitted for laboratory analysis for Petroleum Volatile Organic Compounds (PVOC) and naphthalene during both rounds of sampling. Well gauging data and analytical results are presented in **Section 3.2 and 3.3**, respectively.
- **Barge Dock Phase II LNAPL Skimming System Operation, Maintenance, and Monitoring**
  - The seasonal Phase II system operated with limited interruption from April 28 through October 28, 2021. System data was collected during 18 monitoring events. Phase II system data is presented in **Section 3.4**.
- **LNAPL Recovery MRW-3 and LRMW-7**
  - A seasonal skimming pump tied into the Phase II System operated in well MRW-3 from April 28 through October 28, 2021. System data was collected during 19 monitoring events during the operating period. MRW-3 system data is presented in **Section 3.6**.
  - A second seasonal skimming pump tied into the Phase II System operated in well LRMW-7 from April 28 through May 27, 2021. The seasonal skimming pump was removed from the well on May 27, 2021 due to limited recovery. System data was collected during 5 monitoring events during the operating period. LRMW-7 system data is presented in **Section 3.7**.
- **Abandonment of Five Groundwater Monitoring Wells at the Former Terminal - FedEx Construction Site**
  - Five wells (MW-3, MW-23, RW-6, EW-9 and EW-10) formerly located on the Terminal property were abandoned as detailed in the Well Abandonment Work Plan, an attachment to Request to Manage Materials Form 4400-315, submitted by FedEx on June 14, 2021.

## 2.0 SITE LOCATION AND BACKGROUND

The Former Amoco Terminal is located at 2904 Winter Street in Superior, Wisconsin in the SE ¼ of the NE ¼ of Section 16, Township 49 North Range 14 West, Douglas County, Wisconsin (NE ¼ Sec. 25, SE ¼, Sec. 24 T24N, R20E). The Former Amoco Terminal is comprised of two investigation areas and three open BRRTS numbers, the Terminal (BRRTS #02-16-000331) and the Barge Dock (BRRTS #02-16-117873, #02-16-297979). The Terminal, which was sold by BP in July 2000 to RRS Inc., is 42 acres and has been subdivided for commercial redevelopment. The Barge Dock is 12.6 acres, 3,900 feet long by approximately 125 to 136 feet wide; the two investigation areas are separated by Winter Street and a railroad right of way. An area properties map

illustrating the location of the Terminal and Barge Dock and identifying the associated BRRTS numbers for properties surrounding the site is included as **Figure 1**. An area properties map illustrating the location of BRRTS numbers for the properties which make up the Former Amoco Terminal site is included as **Figure 2**. A map illustrating the wells included in the Amoco Barge Dock, Manifold & Above Ground Storage Tank (AST) Area, and the Terminal Area is included as **Figure 3**.

The Former Amoco Terminal has been used for petroleum storage by various entities since the late 1800s. It had been used by Amoco and its predecessors as a bulk petroleum storage terminal from 1908 until 1999. The Terminal formerly operated with ASTs, an office building, truck loading racks, and a railroad loading rack. The Barge Dock formerly included underground and above ground pipelines, a manifold, ASTs, a railroad loading rack, and a truck loading rack. All Amoco petroleum operations ceased at both properties in 1999. Tanks, rail lines, and loading racks have been removed. Pipelines that connected the Barge Dock to the Terminal were removed within the boundaries of the Barge Dock property in 2003. The remaining extent of pipelines identified within the Terminal and between the Terminal and Barge Dock properties were removed or abandoned in 2020.

Building expansion in the Winter Business Park (**Figure 1**) has included the construction of FedEx Ground Package System at 2929 Halvor Lane in October 2005, and construction of Guardian Pest Solutions at 3131 Halvor Lane in July of 2016. In April 2021, FedEx Corporation entered into a sale agreement to purchase adjacent land to the existing facility at 2929 Halvor Lane. Parcels were resurveyed, and property owned by HCI Limited Partnership and operated by FedEx is shown in **Figure 1**. The remaining Terminal land parcels were purchased in April 2020 by Thompson Land Company and are planned for future sale and commercial and/or industrial redevelopment.

## 3.0 ACTIVITIES COMPLETED APRIL THROUGH OCTOBER 2021

### 3.1 GROUNDWATER GAUGING AND BAILING

During field mobilization events in April 2021, all 118 onsite wells (34 Terminal wells, 68 Barge Dock wells, and 16 North Barge Dock wells) were gauged for depth to water and depth to LNAPL (**Table 1**). All groundwater and LNAPL measurements were obtained using a water level indicator or an oil/water interface probe, which indicates when a probe is in contact with the groundwater or LNAPL in the well. All measurements were recorded to the nearest 0.01-foot. The 2021 Groundwater Sampling Plan (**Table 2**) shows the semi-annual and annual gauging list as well as the semi-annual groundwater sampling schedule. Groundwater and LNAPL gauging data since 1988 are included in **Table 3** (Terminal) and in **Table 4** (Barge Dock). LNAPL extent maps constructed for wells on the Barge Dock and Terminal are presented as **Figure 10** and **Figure 11**. The LNAPL extents are displayed for wells with current gauged LNAPL thicknesses as well as abandoned LNAPL wells and historical CPT/LIF results. LNAPL spatial extents documented during the May gauging events were consistent with historical gauging. Groundwater contour maps constructed with data collected from the full site gauging event on May 24, 2021 are presented as **Figure 4** (Barge Dock, shallow wells), **Figure 5** (Barge Dock, deep wells), and **Figure 6** (Barge Dock, DD level wells).

- Wells in AOCs 9 through 13 (**Figure 10**) exhibited LNAPL thicknesses ranging from 0.63 in LRMW-11 to non-detect LNAPL thicknesses in MWRR-8 which are insufficient for LNAPL recovery. Wells in these AOCs were gauged annually.
- Wells near the edge of the LNAPL plume in the Manifold area (MRW-10, MRW-9, and MWM-6) were regularly gauged during O&M events to demonstrate LNAPL plume stability and limited LNAPL recharge. MRW-09 has not had gauged LNAPL since 7/7/2016. LNAPL thicknesses ranged from 0.51 to

0.53 feet in MRW-10 and from 0.10 to 0.13 feet in MWM-6, thicknesses which were insufficient for LNAPL recovery.

- Wells bailed from April 29 through October 19, 2021 are included in **Table 1** and total annual recovery is as follows:
  - Manifold/AST Area BRRTs #02-16-117873:
    - LRMW-7 (41.5 gallons)
    - MWASt-4 (48.75 gallons)
  - Terminal BRRTs #02-16-00033:
    - MW-32 (1.05 gallons)
    - EW-11 (32.25 gallons)
    - RW-06 (1.65 gallons)
    - MW-23 (2.5 gallons)

Groundwater elevation contour maps constructed from gauging data collected from all wells during the May 2021 gauging and sampling event (**Section 3.3**) illustrate a prevailing north-northwest groundwater gradient. The inferred groundwater flow direction on the Barge Dock and Manifold is also to the north-northwest, which is consistent with historical data collected at the site (**Figures 4, 5, and 6**).

### 3.2 GROUNDWATER SAMPLING

Groundwater samples collected during the May and October 2021 semi-annual sampling events followed the 2021 Sampling Plan presented as **Table 2**. Before collecting the samples, a minimum of 3 well volumes were purged from each well prior to sampling and the groundwater samples were retrieved using disposable well bailers. Water samples were transferred to containers provided by Pace Analytical Services, Inc. (Pace) of Green Bay, Wisconsin with the appropriate preservative and stored on ice until being submitted for analysis. All groundwater samples were submitted to Pace for laboratory analysis of PVOcs and Naphthalene. Chain of custody records are provided with all laboratory reports. Copies of the groundwater analytical laboratory reports are included in **Appendix A**. Groundwater analytical results since 1988 are included in **Table 5** (Terminal) and since 2003 in **Table 6** (Barge Dock).

Semi-annual groundwater sampling was completed from May 25 to May 27, 2021 and from October 4 to October 5, 2021. During both groundwater sampling events, samples were collected from 18 monitoring wells. In addition, two sample duplicates and a trip blank were submitted during both sampling events.

- The following 18 wells were sampled during May and October 2021 events: MW-30D, MW-30S, MW-36D, MW-37D, MW-37DD, MW-40D, MW-41D, MW-45D, MW-46D, MW-49S, MWT-2D, MWM-2D, MWM-7D, MWM-9RD, MWM-10D, MWRR-1D, MWOW-2D, and MWBD-1D.

#### 3.2.1 MAY GROUNDWATER SAMPLING RESULTS

- Water samples from the following wells were reported to exceed the Wisconsin Administrative Code Chapter NR 140 Enforcement Standard (NR 140 ES) for Benzene (5 µg/L) in May 2021: MW-41D (11.2 µg/L), MW-45D (94.3 µg/L), MW-30S (2,510 µg/L), (MWBD-1D (64.1 µg/L), MW-45D (94.3 µg/L), MWRR-1D (444 µg/L), MWM-10D (1,500 µg/L), MW-37DD (987 µg/L), MW-36D (1,600 µg/L), MW-30D (1,890 µg/L), MWM-7D (2,710 µg/L), MWM-9RD (2,130 µg/L), MW-37D (2,200 µg/L), and MWT-2D (2,720 µg/L).
- Water samples from the following wells were reported to exceed the NR 140 ES for Naphthalene (100 µg/L) in May 2021: MW-30S (384 µg/L), MW-30D (196 µg/L) and MWT-2D (111 µg/L).

- Water samples from the following wells were reported to exceed the NR 140 ES for Methyl Tertiary Butyl Ether (MTBE) (60 µg/L) in May 2021: MWT-2D (115 µg/L), MWM-9RD (368 µg/L).
- No water samples were reported to exceed the NR 140 ES for Toluene (800 µg/L) in May 2021.
- No water samples were reported to exceed the NR 140 ES for Ethylbenzene (700 µg/L) in May 2021.
- No water samples were reported to exceed the NR 140 ES for Xylene (2,000 µg/L) in May 2021.
- No water samples were reported to exceed the NR 140 ES for Total Trimethylbenzene (480 µg/L) in May 2021.

### 3.2.2 OCTOBER GROUNDWATER SAMPLING RESULTS

- Water samples from the following wells were reported to exceed the Wisconsin Administrative Code Chapter NR 140 Enforcement Standard (NR 140 ES) for Benzene (5 µg/L) in October 2021: MWBD-1D (68.5 µg/L), MW-45D (104 µg/L), MWRR-1D (68.5 µg/L), MWM-10D (1,380 µg/L), MW-36D (1,360 µg/L), MW-30D (1,910 µg/L), MW-30S (2,210 µg/L), MW-37D (2,270 µg/L), MW-37DD (1,060 µg/L), MWM-9RD (2,350 µg/L), MWM-7D (2,650 µg/L), and MWT-2D (2,520 µg/L).
- Water samples from the following well was reported to exceed the NR 140 ES for Naphthalene (100 µg/L) in October 2021: MW-30D (163 µg/L), and MW-30S (309 µg/L).
- Water samples from the following wells were reported to exceed the NR 140 ES for Methyl Tertiary Butyl Ether (MTBE) (60 µg/L) in October 2021: MWT-2D (111 µg/L) and MWM-9RD (480 µg/L).
- Water samples from the following wells were reported to exceed the NR 140 ES for Toluene (800 µg/L) in October 2021: MW-30S (2,130 µg/L).
- No water samples were reported to exceed the NR 140 ES for Ethylbenzene (700 µg/L) in October 2021.
- No water samples were reported to exceed the NR 140 ES for Xylene (2000 µg/L) in October 2021.
- No water samples were reported to exceed the NR 140 ES for Total Trimethylbenzene (480 µg/L) in October 2021.

### 3.2.3 GROUNDWATER SAMPLING TRENDS

The areal extent of the dissolved-phase benzene plume in the shallow (water table) zone on the Barge Dock parcel from the May and October 2021 groundwater sampling data is illustrated in **Figures 7a and 7b**.

- Concentrations in well MW-49S experienced anomalous benzene concentrations during October 2018 sampling events (1,970 µg/L). The well has remained on the semi-annual groundwater sampling list, and benzene concentrations in the well over the last six sampling events have remained below or near benzene enforcement standards. The most recent groundwater sampling event for the well reported a benzene concentration of 0.32 µg/L (October 2021). This well will continue to be sampled on a semi-annual basis to verify contaminant concentration trends.
- Monitoring well MW-30S is located in the area where the thickness of the surficial clay layer starts to increase and terminates near the historical range of groundwater levels. From the boring log for MW-30S, the stiff red clay layer was observed to extend to a depth of 15 ft bgs, at which point the lithology changes to water bearing fine to medium grain sand. This lithostratigraphy creates unique variations in hydraulic pressure, with greater hydraulic pressures when the water table (represented as the piezometric) is located within the clay layer, and lower pressures when the water table is below the clay and within the sand layer. As shown in the hydrograph for MW-30S, the dissolved-phase benzene concentrations tend to vary based on the groundwater levels, with the higher benzene concentrations observed during lower hydraulic pressures when the water table drops to levels near the base of the clay at 15 feet bgs. The seasonal high benzene concentrations observed over the last 22 years of sampling are range bound (vary within a certain range around the trend line), while the high concentrations exhibit a decreasing trend as shown in **Appendix B**.

- The Barge Dock dissolved-phase benzene plume in the “D” level vertical delineation zone extends west of the manifold and beneath the C. Reiss Coal property to the west edge of the Hallett Dock property and is delineated horizontally and vertically by wells within “S”, “D”, “DD”, and “DDD” screened depths.
  - The inferred areal and vertical extent of the dissolved-phase benzene plume within the “D” level is fully delineated by the historical non-detect concentrations in multiple vertical levels of delineation wells which include MW-30DDD, MW-37DDD, MW-38DD, MW-41DD, MW-50D, MW-51D, MW-52D, and MW-52DD (**Table 6**). Wells MW-50D, MW-51D, MW-52D, and MW-52DD define the vertical extent of the dissolved phase plume to the west and wells MW-41D, MW-38D, and MW-38DD define the vertical extent of the dissolved phase plume to the north.
  - MWBD-1D benzene concentrations have continued to decrease since the historical high of 213 µg/L in May 2016, and historical non-detect results for benzene in well MWBD-1DD fully delineate the dissolved phase vertical extent in the area.

Historic dissolved benzene graphs and groundwater hydrographs are presented for ten of the sampled vertical delineation wells (MW-30S, MW-30D, MWT-2D, MWM-9RD, MWM-7D, MW-36D, MWM-10D, MW-37D, MW-41D, and MWBD-1D) in **Appendix B**. These wells demonstrate the dissolved phase benzene trends within the plume and are delineated both horizontally and vertically by wells with non-detect concentrations or concentrations below NR 140 ES. Dissolved benzene concentrations correlate with groundwater levels, with low groundwater levels producing higher dissolved-phase concentrations. Well MWM-7D exhibited the lowest groundwater level since May 2015 during the October 2021 sampling event, which has resulted in increasing benzene concentrations. These concentrations are still consistent with historical results as described in **Section 3.2.4**. Similar results were observed in well MWM-10D, which exhibited the lowest groundwater level since May 2015 during the October 2021 sampling event, which correlated with higher benzene concentrations that are still within historical range of sampling results (**Section 3.2.4**). Both of these wells are located near the center to the eastern extent of the dissolved phase plume as shown in **Figures 8a and 8b**.

### 3.2.4 GROUNDWATER ANALYTICAL ANALYSIS

Groundwater sampling for the select dissolved-phase plume monitoring wells is currently conducted on a semi-annual basis. Semi-annual or quarterly sampling is often conducted to observe the effect of seasonal variations in groundwater elevations or contaminant migration, although many of the monitor wells at the Superior Terminal have been sampled on a semi-annual basis for 1, 2 or even 3 decades. Remediation completed at the Terminal and Barge Dock has reduced the volume of LNAPL, which has removed a great amount of petroleum mass that otherwise would have entered into the groundwater as dissolved-phase hydrocarbons (Antea Group, 2019)<sup>1</sup>. This has led to stable or decreasing dissolved-phase petroleum hydrocarbon concentrations in monitor wells in the dissolved phase plume; especially over the last decade.

Stable or decreasing dissolved-phase concentrations have been observed in three long-standing monitor wells located north of Winter Street – MWT-2D, MW-30S, and MW-30D. Each of these monitor wells has been sampled for more than one decade on a semi-annual basis, as shown in **Figure 10** which includes the graphs of benzene concentrations over the entire sampling record. Monitor well MWT-2D has a sampling record that spans about 1½ decades, while the sampling records for monitor wells MW-30D and MW-30S span 2½ and 3 decades, respectively. In the case of monitor wells MWT-2D and MW-30D, the variability in benzene concentrations was readily apparent early in the sampling record but has since become stable, with decreasing trends. The reason for benzene concentrations becoming stable in monitor wells MWT-2D and MW-30D is

---

<sup>1</sup> Antea Group (2019) *Technical Memorandum – Evidence and Quantification of LNAPL Mass Depletion*.

related to the depletion of the residual LNAPL through active remediation, as well as natural source zone depletion (NSZD), and subsequent degradation of the dissolved-phase hydrocarbons through natural attenuation. The lack of a clear, stable trend in benzene concentrations for monitor well MW-30S has been attributed to that well’s proximity to a thickening of the surficial clay unit whereby changes in groundwater elevation produces alternating confined and unconfined conditions that appear to produce an increase in benzene concentration when the groundwater elevation decreases. This would suggest that dissolved-phase, sorbed, or residual hydrocarbons held above the clay-sand interface during periods of high groundwater elevation are then able to enter the screen of monitor well MW-30S when the groundwater elevation declines.

To demonstrate that benzene concentrations in most monitor wells at the site are stable, if not actually declining, the Groundwater Statistics Tool (USEPA, 2018)<sup>2</sup> was used to develop the Confidence Intervals (at the 95% level) for representative monitor wells north of Winter Street. The purpose of this analysis is to provide supporting evidence that the frequency of groundwater sampling may be reduced to annual with no detrimental effects of being able to adequately analyze and interpret the data to understand and respond to the extent, magnitude, and changes in hydrocarbon concentrations.

The Interstate Technology and Regulatory Council (ITRC, 2013)<sup>3</sup> states that confidence limits are the maximum and minimum values bracketing the statistic of interest (usually the mean of the population data) at a certain Confidence Level (usually 95%). In other words, Confidence Limits are the maximum or minimum values above or below which you are confident (at the selected Confidence Level, such as 95%) that the statistic (the mean) will occur. Doyle (2011)<sup>4</sup> stated that the Confidence Interval shows the location where there is a 95% chance the actual linear trend line of the data exists. Based on the characterization of 95% Confidence Interval cited by Doyle (2011), which constrains the location of the linear trend line, the 95% Confidence Interval is also a reasonable measure of the expected range for benzene concentrations.

The 95% Confidence Interval was calculated for 11 monitor wells as follows: MWT-2D, MW-7D, MWM-9RD, MW-10D, MW-30S, MW-30D, MW-37D, MW-37DD, MW-41D, MW-45D, and MWBD-1D. Each of these monitor wells, located north of Winter Street, has an adequate groundwater sampling record to provide reasonable statistical results, and portrays varying distributions of benzene concentrations to demonstrate the applicability of the 95% Confidence Interval in support of refinement of the sampling frequency.

The analyses for Confidence Limits for the 11 monitor wells are graphically summarized in **Appendix G**. A summary of the figures is as follows:

| Well ID | Number of Data Points Analyzed | Date Range Analyzed | Data Points within 95% Confidence Limits | Spread of 95% Confidence Interval (µg/L) |
|---------|--------------------------------|---------------------|--|--|
| MWT-2D  | 10                             | 6/15/2017-10/5/2021 | 9  | ±250                                     |
| MWM-7D  | 10                             | 6/15/2017-10/5/2021 | 9  | ±200                                     |

As shown in **Appendix G** and summarized above, a majority of the wells analyzed displayed a lack of scatter in benzene concentrations over the last 10 sampling events with 70% to 90% of the benzene concentrations within the 95% Confidence Interval. For those monitor wells where the scatter of the data was more pronounced (MW-30S and MW-41D), fluctuations can be attributed to hydrostratigraphic, well construction, or low benzene concentrations that would be affected by slight changes in mass. Maintaining the groundwater sampling schedule on a semi-annual basis would not provide any additional insights that would further refine the Conceptual Site Model or allow Antea Group and the WDNR a better approach to managing the site. Therefore, a reduction to annual groundwater sampling is recommended.

### OPERATION AND MAINTENANCE OF PHASE II SYSTEM, APRIL – OCTOBER 2021

The seasonal Phase II system was operated from April 28 – October 28, 2021. System data was collected during 19 monitoring events within the cited operational period. The Phase II System was installed in 2012 as a seasonally operated (Spring through Fall) system with above-grade piping to span the LNAPL plume extending from the Barge Dock manifold across the C. Reiss Coal property to the west. The system originally consisted of a network of seven LNAPL recovery wells, of which five wells remain active (MRW-5, MRW-6, MRW-7, MRW-8, and MWM-3) as wells MRW-9 and MRW-10 at the western extent of the heritage LNAPL plume contain limited or no LNAPL thicknesses. Wells MRW-5, MRW-6, MRW-7, and MRW-8 are 6 inches in diameter, and MWM-3 is 4 inches in diameter. Each active recovery well contains a pneumatic skimming pump that tracks the water table using a floating head intake and removes LNAPL that accumulates in the recovery wells. Recovered LNAPL is pumped into a 7,000-gallon capacity, double-walled, steel AST located next to the system building. Cumulative Phase II System LNAPL recovery is illustrated in **Figure 12a** and summarized in **Table 7**. The Phase II system is monitored on an approximate weekly basis during the first months of system startup, and on a semi-weekly basis near the end of the operating season.

Approximately 95% of historical LNAPL recovered from Barge Dock wells is from the Finger Plume area (the elongated extent of LNAPL that extends to the west-southwest from the former Barge Dock manifold for approximately 700 feet, see AOC 8 in **Figure 10**), which has been recovered using the mobile skimmer, Phase I system, and Phase II system. The WDNR Operation, Maintenance, Monitoring, and Optimization Form is included in **Appendix C**.

- The total amount of LNAPL recovered by the Phase II skimming system from April 28 to October 28, 2021 was approximately 981 gallons. Annual recovery continues to exhibit decreasing trends, as the

2021 recovery totals were the lowest recoveries to date within a consistent operational period (**Figure 12c**)

- Well cycle count values were recorded and tracked for each system pump, which when using the rated pump recovery per cycle value can be converted to approximate gallons recovered between O&M events per well. Tables and graphs showing recovery per well from 2018-2021 are presented in **Appendix E**.
  - Wells MRW-7, MRW-8, and MRW-5 continue to demonstrate that they have been the primary three recovering wells within the Phase II system from 2018-2021.
- The average Phase II system product recovery rate after system startup from May 6 to October 28, 2021 was 5.3 gallons per day or approximately 1.06 gallons per day per active recovery well.
- Total LNAPL recovery since Phase II system startup in June 2012 is approximately 39,825 gallons.

Following metrics provided in ASTM E2531-06 (Standard Guide for Remediation Strategies for LNAPL), recovery systems can be defined as no longer effective when monetary costs exceed \$50/gallon equivalent with no further meaningful change in flux or longevity, or when the system achieves less than 0.1% of additional recovery per day relative to cumulative recovery totals. Operational costs for O&M events and data management were compiled for the 2021 operating season and based on the 981 gallons of recovery for the season, operational costs for the system were estimated at \$52 per gallon. In addition, the average recovery rate of 5.3 gallons per day is 0.013% of the cumulative recovery totals. Based on these metrics, and the continued decrease in system recovery, Antea Group recommends consideration be given to discontinuing LNAPL recovery through the system during the next technical assistance meeting with the WDNR in 2022 (Section 4.2) with the upcoming 2022 operating season being the last.

### 3.3 MRW-3 LNAPL RECOVERY

On April 28, 2020, a three-inch diameter pneumatic skimming pump was installed in MRW-3, a six-inch diameter monitoring well. The skimming pump has a fixed intake which removes LNAPL that accumulates in the recovery well. Recovered LNAPL is pumped through a high-density polyethylene (HDPE) product line into a 1,000-gallon storage tank. An airline was installed that connects the MRW-3 pump to the Phase II System compressor to operate the pump.

The LNAPL recovery pump operated from April 28 to October 28, 2020. System data was collected over 18 monitoring events (**Table 9**). Product thicknesses during system operation ranged from 7.91 feet on April 28 to 0.09 feet on August 10 (**Table 4**). The pump was shut off on October 28, 2021 for the end of the seasonal operating period. The total product recovery from 2021 pump operations was 200.6 gallons of LNAPL. Total product recovered from the well since pump operations began in 2017 is 715.3 gallons.

The LNAPL recovery pump will only be reinstalled during the 2021 season if sufficient LNAPL exists and is sustained in the well. If sustained product does not exist, regular gauge and bail events will be utilized for product recovery.

### 3.4 LRMW-7 LNAPL RECOVERY

On April 28, 2021, a three-inch diameter pneumatic skimming pump was installed into LRMW-7, a four-inch diameter monitoring well. The skimming pump has a fixed intake which removes LNAPL that accumulates in the recovery well. Recovered LNAPL is pumped through a HDPE product line into a 1,000-gallon storage tank that had been previously used for storage of hand bailed product. An airline, installed on August 30, 2017, connects the LRMW-7 pump to the Phase II System compressor to operate the pump.

The LNAPL recovery pump operated from April 28 through May 27, 2021. System data was collected over 5 monitoring events (**Table 10**). Product thicknesses during system operation ranged from 8.36 feet on April 28 to 5.54 feet on May 6. The system was shut off on May 27, 2021 and the pump was removed due to limited recovery. The LNAPL from the well was removed by bailing for the remainder of the operating season. The total product recovery from 2021 pump operations was 6.3 gallons of LNAPL. Total product recovered from the well since pump operations began in 2017 is 257.4 gallons.

LRMW-7 was gauged and bailed eleven times from May 28 to October 19, 2021 with total recovery of 41.5 gallons of LNAPL (**Table 1**). Regular gauge and bail events will be utilized for product recovery during the 2022 season.

### 3.5 WELL ABANDONMENTS

FedEx Ground Package System (FedEx) at 2929 Halvor Lane completed contracts for the purchasing of additional parcels adjacent to the existing facility in April 2021, and redevelopment plans were submitted for the expansion of the existing facility to include additional semi-truck and auto parking spaces. In order to accommodate the proposed expansion plans and redevelopment for the FedEx facility, the consultant (BBJ Group) requested that existing monitoring and recovery wells near the proposed expansion be abandoned. A Well Abandonment Work plan for the abandonment of monitoring and recovery wells MW-3, MW-23, and RW-06 was submitted on March 12, 2021 as an attachment to the Request to Manage Materials Form 4400-3615, submitted by BBJ Group (their consultant) on May 24, 2021. After verification of the site development plans, an addendum to the Well Abandonment Plan to include the abandonment of monitoring wells EW-09 and EW-10 was submitted by BBJ Group on June 14, 2021. In the Materials Management Plan approval letter sent by the WDNR on August 31, 2021, an approval was received for the abandonment of the five requested monitoring and recovery wells.

Abandonment of the monitoring and recovery wells was completed by Bergerson Caswell Inc under the supervision of Antea Group on August 31, 2021. All wells were filled using hydrated bentonite pellets. Prior to abandonment the depth to product and depth to water values were gauged. Original well construction details, casing recovery totals, and grout totals are included in the table below:

| Well ID | Well Diameter (inches) | Well Screened Interval (ft bgs) | Total Well Depth (ft bgs) | Casing Height Removed (ft bgs) | Grout Fill (lb) |
|---------|------------------------|---------------------------------|---------------------------|--------------------------------|-----------------|
| MW-3    | 2                      | 14.3-24.3                       | 25                        | 3                              | 25              |
| MW-23   | 2                      | 9.2-24.2                        | 25.4                      | 3                              | 25              |
| RW-06   | 6                      | 18.5-45.2                       | 45.2                      | 15                             | 500             |
| EW-09   | 4                      | 15-35                           | 35                        | 1.5                            | 200             |
| EW-10   | 4                      | 15-35                           | 35                        | 5                              | 200             |

Well abandonment forms are included in **Appendix F**.

### 3.6 WASTE DISPOSAL

Green for Life Environmental (GFL, formerly Future Environmental) removed approximately 2,200 gallons of investigation-derived liquid waste (purge water, hand bailed LNAPL, and LNAPL system recovered groundwater) from the site on October 29, 2021. The liquid waste was treated at GFL's facility in Mokena, IL for oil recovery and water treatment. The waste manifests are included in **Appendix D**.

## 4.0 CONCLUSIONS AND RECOMMENDATIONS

### 4.1 CONCLUSIONS

- The following LNAPL recovery systems were active during the April to October 2021 operating period:
  - Cumulative Phase II system recovery for the 2021 season was 981 gallons, which is a continuation of the declining trends of LNAPL recovery year after year (**Figure 12b**). This declining trend is expected to continue during the 2022 season.
  - Pneumatic pump cycle counts for wells in the Phase II system show varying liquid recovery rates per well, with a majority of the recovered fluids coming from two of the operating pumps (MRW-7 and MRW-8).
  - The pneumatic skimming pump in MRW-3 recovered approximately 200.6 gallons of LNAPL from April 28 through October 28, 2021. The system has recovered approximately 715.3 gallons of LNAPL since recovery pump installation on August 22, 2017.
  - The pneumatic skimming pump in LRMW-7 recovered approximately 6.3 gallons of LNAPL from April 28 through May 27, 2021. The system has recovered approximately 257.4 gallons of LNAPL since pump installation on August 30, 2017.
- Groundwater sampling analytical results at well MW-30S display correlations to groundwater levels and the stratigraphy at the well. The dissolved phase benzene high concentrations correlate with the low water levels, and these seasonal high concentrations exhibit a decreasing trend.
- Dissolved benzene concentrations also correlate with water levels at deep level wells. Wells MWM-7D and MWM-10D had the lowest water levels in 6 years during the October 2021 sampling event, which resulted in increased benzene concentrations. These concentrations are still within the historical sampling range.
- For the regularly sampled dissolved phase monitoring wells, analytical results display a lack of scatter over the last 10 sampling events, and a majority of results fall within a 95% confidence interval. Based on these statistically consistent results, maintaining the groundwater sampling schedule on a semi-annual basis would not provide any additional insights that would further refine the Conceptual Site Model or allow Antea Group and the WDNR a better approach to managing the site.
- North Barge Dock wells in AOCs 9-13 continue to exhibit limited (0.00 to 0.63 feet) LNAPL thicknesses (**Table 1**) and no LNAPL recovery potential.
- Five Terminal wells, MW-3, MW-23, RW-06, EW-9, and EW-10, were abandoned on the Terminal property to allow for construction and expansion of the adjacent FedEx facility.

### 4.2 RECOMMENDATIONS

- The Phase II system has reached asymptotic recovery, and following metrics provided in ASTM E2531-06 can be defined as no longer effective. This effectiveness is based on the estimation that the 981 gallons of recovery in 2021 exceeded the \$50/gallon economic metric and the calculation that the average recovery rate of 5.3 gallons per day is 0.013% of the cumulative recovery totals (39,825 gallons). Based on these metrics, Antea Group recommends discussing discontinuing the Phase II recovery system following the 2022 operating season.

- Continue operation of LNAPL recovery pump in well MRW-3 if sufficient thicknesses exist and recovery is sustained. The LNAPL recovery pump will be removed if sustained recovery is not observed, and the wells will be switched to a regular gauge and bail schedule.
- Continue annual reporting of site operations and events. Work summaries for January through June 2022 events will be compiled and submitted to maintain compliance with online reporting in accordance with NR 700.
- Adjust the groundwater sampling to an annual frequency which will include gauging and sampling wells included on the 2022 Groundwater Sampling Plan in the spring (**Table 8**).
- A technical assistance meeting will be requested before the 2022 Site operating season begins to discuss the site investigation events and sampling results completed from 2019-2021. These site activities were completed in response to comments and suggestions included in letters from the WDNR (dated June 27, 2019) as well as discussions held at the Technical Assistance meeting on September 16, 2019. The goal of these activities was to complete site delineation, so that revised Site Investigation Reports (SIRs) for the three BRRTS number sites could be submitted under anticipated department approval. The revised SIRs are anticipated to be submitted by June 30, 2023.
- Remedial Action Option Reports (ROARs) for the three BRRTS number sites will be revised according to comments and suggestions included in letters from the WDNR (dated June 27, 2019) as well as discussions held at the Technical Assistance meeting on September 16, 2019, and the anticipated 2022 Technical Assistance meeting. The three reports are anticipated to be resubmitted by January 30, 2024.

## 6.0 REMARKS

The recommendations contained in this report represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this report. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this report.

**NOTES:**  
X..... = Wells included in the Amoco Barge Dock-Mainfold & AST Area Sampling Plan  
<..... = The compound was not detected at or above the indicated method detection limit. Unlisted detection limit concentrations were unavailable.  
ug/L ..... = Micrograms per liter (equivalent to parts per billion)  
LNAPL ..... = LNAPL in Well, could not be sampled  
**"BOLD"** ..... = The indicated concentration exceeds the NR 140 ES of 5 µg/L  
NR 140 ES ..... = Wisconsin Administrative Code Chapter NR 140 Enforcement Standard

**Table 3**

AMSL = Above Mean Sea Level  
\* Corrections for free product made using: TOC elevation-[depth to ground water-(product thickness \* product density)]  
Average Product Density = 0.77 g/cm3 based on average of 4 NE terminal wells (Table 8) - MW-32, RW-2, RW-4 and RW-6

**Table 4**  
**Groundwater and LNAPL Gauging Data - Barge Dock**  
Former Amoco Terminal  
Superior, Wisconsin

| Well ID | Date       | Ground Elev. | TOC Elev. | TOS Elev. | BOS Elev. | Depth to Product (feet BTOC) | Free Product Thickness (feet) | Depth to Water (feet BTOC) | Corrected DTW (feet bgs) | Corrected GW Elevation | Change in Corrected GW Elevation | Liquid in Well (feet) | Screen Submerged Below Water Table? (YES/NO) | Comments/Observations      |
