1.0 INTRODUCTION

This Design Report has been prepared in general accordance with applicable sections of Chapter NR 724 of the Wisconsin Administrative Code to address soil and groundwater contamination at the PSK Investments LLC (PSK) and Grace Christian Fellowship (Grace Christian) properties in Milwaukee, Wisconsin. This Design Report is based on the Revised Remedial Actions Options Plan (RAOR) prepared by SCS Engineers (SCS) and dated April 9, 2014, and the Wisconsin Department of Natural Resources (WDNR) approval letter dated June 1, 2015.

The 2014 Revised RAOR identified the following remedial actions:

- Grace Christian Building – Soil excavation and expanded basement sub-slab venting system
- PSK Property – Soil vapor extraction
- PSK Property – Installation of groundwater sump

The 2014 Revised RAOR was the result of negotiations between PSK and Grace Christian. Both PSK and Grace Christian believe that the revised remedial approach described in the RAOR will result in a more efficient and cost-effective remedial action for the existing impacts, as well as an improved approach for protecting Grace Christian from potential future releases at PSK.

2.0 NATURE AND EXTENT OF CONTAMINATION

A complete summary of the site investigation findings is provided in the October 2012 Site Investigation Summary and Remedial Action Options Report, dated October 2012. A summary of the site investigation is provided below.

2.1 SITE HISTORY

The following site history is based on reports prepared by Warzyn; K. Sighn & Associates, Inc. (KSA); OM Enterprises (OM); Shaw Environmental & Infrastructure, Inc. (Shaw); North Shore Environmental Construction (NSEC); and correspondence from the WDNR, the Wisconsin Department of Health and Family Services, and others.

Contamination at the subject site was first reported to the WDNR in 1984. Warzyn began a site investigation on behalf of Mobil Oil, the site owner until 1984. Warzyn submitted a Site Investigation and Remedial Action Plan to the WDNR in May 1992. In December 1996, KJG Investments, LLC (KJG) purchased the property at 9922 West Capitol Drive in Milwaukee, Wisconsin, which is now a Mobil gas station. KSA, the former consultant for KJG, proposed a cleanup goal for benzene in soil of 500 parts per billion (ppb) in correspondence dated July 16, 1997. In correspondence dated December 15, 1997, the WDNR indicated that the proposed cleanup goal for benzene in site soil would be 1,000 ppb.

Between October 1997 and April 1998, approximately 3,600 tons of petroleum-contaminated soil was excavated and removed from the site. Excavation sidewall samples indicated that soil with benzene concentrations greater than 1,000 micrograms per kilogram ($\mu\text{g}/\text{kg}$, or ppb) remained in place after the excavation. Granular fill was used to backfill the excavation to a depth of about 6.5 feet below ground surface (bgs). Two new gasoline underground storage tanks (USTs), consisting of a 10,000-gallon premium tank and a 12,000-gallon unleaded tank, were installed in December 1997. The new USTs and the dispensing piping were constructed of fiberglass. Following the excavation, three replacement groundwater monitoring wells were installed and sampled four times by KSA.

On October 18, 1999, KSA submitted a case closure request to the WDNR. The closure request documented that soil contamination remained on site and the extent of contamination was estimated to include the adjacent property to the east (now owned by Grace Christian). The WDNR granted case closure in a correspondence dated January 10, 2000.

Grace Christian purchased the 9900 West Capitol Drive property, which is adjacent to the KJG property, in July 2001. PSK Investments, LLC became owner of the KJG property in 2006. Details about the investigation prior to 2006 are summarized in the October 18, 1999 KSA Case Closure Request to the WDNR.

On April 26, 2006, petroleum odors were observed in the Grace Christian building, and subsequent investigation suggested the odors were coming from the drain tile sump located in the northwest corner of the church basement. The WDNR was notified of the incident by Grace Christian the same day.

On April 27, 2006, the gas station determined that a flex hose under a dispenser on the eastern side of the property had leaked. The Milwaukee Hazmat team evacuated the church. Grace Christian hired NSEC to vent the vapors. OM summarized details and the chronology of remedial actions for the recent release in the Status of Site Investigation and Remedial Action (New Spill) report, dated December 13, 2006.

The Site Investigation Report dated October 15, 2007, and prepared by OM indicates product migrated west from the supply island northwest to the UST area within the coarse-grained backfill materials placed beneath the dispensing lines. The report indicates that product migrated north from the USTs within coarse-grained soils and fill materials to the storm and/or sanitary sewers located in the alley north of the PSK (formerly KJG) and Grace Christian sites. The elevation of the storm sewer is approximately equivalent to the elevation of the base of the basement floor of Grace Christian. According to OM, the bottoms of the USTs are likely in close proximity to the coarse-grained backfill materials east of the Grace Christian building within the coarse-grained backfill material of the storm and/or sanitary sewers that run beneath the sidewalk on the north side of the PSK and Grace Christian properties. Therefore, the coarse-grained, granular fill in the utility corridors, which is more permeable than the native clay soils, likely facilitated the vertical and horizontal migration of product from the east supply island to the Grace Christian building. After the product reached the base of the building's footings, it migrated horizontally through the network of clay tile and coarse-grained backfill materials placed beneath and adjacent to the footings. The product migrated through the drainage tile installed in the footings during the construction of the building, and subsequently into the sump located in the northwestern part of the Grace Christian building.

On April 28, 2006, NSEC excavated 143.03 tons of soil adjacent to the west wall of the Grace Christian building, which was conducted to expose the perimeter drain tile of the Grace Christian building. NSEC then installed a PVC riser from the drain tile to the roof of the Grace Christian building. A blower was installed to remove vapors from the drain tile. The blower and drain tile vent continue to operate. A schematic of the perimeter drain tile ventilation system installed by NSEC is shown on Figure 1 of the Supplement to Statement of Professional Opinion and Remedial Strategy for Site Closure by Shaw, dated July 30, 2012. In addition, NSEC installed a 6-inch-diameter, 15-foot-deep sump well (excavation sump) for free product and water removal near Grace Christian's drain tile.

From April 30, 2006, to May 13, 2006, OM, the environmental consultant for KJG, conducted daily free product and water removal from the excavation sump installed by NSEC. From May 13, 2006, through December 2006, OM conducted weekly free product and water removal from the excavation sump.

2.1.1 Grace Christian Basement Sub-Slab Ventilation System Summary

2.1.1.1 Hogan and Shaw Investigation in 2008 to 2012

In February 2008, Theodore J. Hogan and Associates, Inc. (Hogan) worked with Shaw to perform indoor air screening with a photoionization detector (PID) and collected short-term samples of basement sub-slab soil vapor and indoor air using summa canisters for laboratory analysis. The measured vapor concentrations from beneath the basement floor of the building in 2008 exceeded the U.S. Environmental Protection Agency (USEPA) shallow gas screening levels.

In February and March 2008, Shaw collected 24-hour ambient air samples in the Grace Christian basement using summa canisters. According to Shaw, the results of the analytical testing indicated that petroleum volatile organic compounds (PVOCs) were detected in the ambient air at concentrations above the USEPA indoor air screening levels. Results are summarized on Figures 8 (Figure 7, Shaw 2008) and 9 (Figure 8, Shaw, 2008) by Shaw.

In early August 2009, Shaw conducted PID monitoring in the Grace Christian basement with the perimeter drain tile ventilation system turned off, and also conducted PID monitoring of the system exhaust when the ventilation system blower was turned back on. Shaw and Hogan conducted a second round of sampling later in August 2009. Volatile organic compound (VOC) vapors were detected in the samples. The sampling and results are described in the Amended (At Request of Counsel) Results of Recent Vapor Monitoring and Groundwater Sampling by Shaw, dated December 22, 2009.

2.1.1.2 Basement Sub-Slab Ventilation System Installation in 2008

In June 2008, Veolia, under contract by the WDNR, detected the presence of VOCs in ambient air in exceedance of USEPA indoor air screening levels in the Grace Christian building. The WDNR retained Radon Abatement, Inc. in August 2008 to install a basement sub-slab ventilation system. A description of the construction of the system is in the Shaw Results of

Supplemental Sampling and Statement of Professional Opinion, dated June 29, 2009. Shaw observed the work and collected soil and water samples from below the Grace Christian basement floor during the system installation. Shaw also measured vacuum at 12 basement sub-slab ports until April 2009 and concluded that the pressure influence area had reduced since starting the monitoring in October 2008, but the flow rates and PID results from the ventilation system were consistent during the monthly sampling events. The basement sub-slab ventilation system has been operated since 2008.

2.1.1.3 Tuomanen Evaluation in 2008 and in 2012

Mr. Robert Tuomanen, CIH, CSP, CPEA, an industrial hygienist, evaluated the site investigations conducted by Shaw and Hogan in 2008¹ and updated his evaluation in 2012 for changes in USEPA's Integrated Risk Information System.

Mr. Tuomanen believed that the PID readings from the past investigations were inconclusive and were not the appropriate tool to assess human health risks from vapor intrusion. Mr. Tuomanen states in the Addendum and Supplemental Report of Results on Health Risk Posed to Occupants of the Grace Christian Fellowship School by Vapor Intrusion for Subslab Gasoline Contamination, dated July 23, 2012, "A risk assessment of measured indoor air concentrations of gasoline-related compounds in the Grace Church basement concludes that an unacceptable human health risk does not exist to the students and teachers of the Grace Christian School."

2.1.1.4 Alpha Terra Investigation and Hogan Evaluation in 2012

On behalf of Shaw, Alpha Terra Science, Inc. (Alpha Terra) conducted a soil and soil vapor investigation in June 2012 for Grace Christian. The additional sampling was conducted to further evaluate existing conditions beneath the basement floor. Alpha Terra summarized the results of the investigation in the Evaluation of Subslab Vapors and Soil Chemistry report, dated July 11, 2012. Shaw also summarized the investigation and findings of this investigation in the Supplement to Statement of Professional Opinion and Remedial Strategy for Site Closure, dated July 30, 2012.

Alpha Terra advanced seven vapor probes (Figure 10 [Figure A, Alpha Terra, 2012]) in the western portion of the basement – four probes were installed along the western interior wall, and three probes were installed in the sub-slab ventilation system installed in 2008. The perimeter drain tile and basement sub-slab ventilation systems were shut down 12 days prior to monitoring to allow the basement sub-slab conditions to return to static conditions. A PID was used to sample the vapors directly beneath the slab upon opening the tile and slab. Based on field PID readings, B-102 and B-106 located in the basement sub-slab ventilation system were fitted with sampling ports for the collection of sub-slab vapor samples with summa canisters. The summa canisters were analyzed by a laboratory using USEPA Method TO-15.

Alpha Terra also recorded PID readings and collected two vapor samples in summa canisters from the perimeter drain tile and basement sub-slab ventilation system exhaust vents located on

¹ Hydro-Environmental Technologies, Inc., Report on Health Risks Posed to Occupants of the Grace Christian Fellowship School by Vapor Intrusion from Sub-Slab Gasoline Contamination, Grace Christian Fellowship, Milwaukee, Wisconsin, October 2008.

the roof of the Grace Christian building once the systems were restarted. The summa canisters were analyzed by a laboratory using USEPA Method TO-15.

Vapor screening with a PID was also conducted in the four sub-slab sumps (S-1 through S-4) installed by Shaw in 2008 as part of the interim basement sub-slab ventilation system.

Based on the vapor screening results, Alpha Terra also collected soil samples from vapor sampling locations B-102 and B-106. The locations were cored using a hand auger to 19 inches below the floor slab. Samples were collected and submitted to a laboratory for PVOC and naphthalene analysis. Analytical results for these recent samples are provided in Table 4 (Table 3, Shaw, 2012).

Alpha Terra measured volatile organic vapors with the PID in a range from non-detect to 363,000 instrument units, equivalent to 363,000 ppb by volume, at location VP-106, adjacent to the western sumps of the drain tile (or basement sub-slab) ventilation system. Volatile organic vapors were not detected in the probes advanced along the western interior wall of the basement. No volatile organic vapors were measured in sumps S-1 and S-2, but 28 and 12 instrument units (or ppb) were measured in S-3 and S-4, respectively.

The summa canister sample results from B-102 and B-106 were compared to the Soil Gas Screening Levels identified by WDNR, and they exceed the hazard index of 1.0 for the cumulative total of non-carcinogenic VOCs, as well as the target risk of 1 in 100,000 for carcinogenic compounds for both vapor samples. The summa canister sample result from the perimeter drain tile venting system exceeded the target risk, while the sample result from the basement sub-slab venting system did not.

PVOCs exceeding the residual contaminant levels (RCLs) were detected in the sub-slab soil samples collected from B-102 and B-106. The concentrations in B-106 were elevated and similar to the concentrations of PVOCs that were previously detected in sub-slab soil samples collected in 2006 and 2007, prior to the installation of the basement sub-slab ventilation system in 2008.

Hogan² evaluated Alpha Terra's results and concluded that the potential for human exposure remains as long as the PVOC-contaminated soil is present beneath the basement slab. Hogan believes the contamination comes into the basement room and the HVAC system through the building floor cracks, joints, and building columns; and that the soil contamination beneath the Grace Christian basement slab is a threat to the building's occupants.

2.2 2016 SAMPLING RESULTS

On March 15, 2016, groundwater samples were collected from monitoring wells MW1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, MW-11, MW-20, and MW-21, the Grace Christian basement sump, and the Grace Christian extraction sump. The groundwater elevation at each monitoring well was measured prior to purging the wells before sampling. The samples

² Hogan, Theodore J., 4th Addendum to Expert Report, Grace Christian Fellowship, Milwaukee, Wisconsin, July 31, 2012.

were shipped to TestAmerica Laboratories for analysis of PVOCs. The results of the laboratory analysis are summarized in **Table 1** and included in **Appendix A**. The groundwater elevations are included in **Table 2**, and a water table map is included on **Figure 3**. The March 2016 sample results are generally consistent with past sampling results and show that petroleum contaminant concentrations have decreased with time, in all wells with the exception of MW-20 which showed an increase in benzene and ethylbenzene concentrations. The water table appears to be mounded in the northwest part of the KJG property. The direction of groundwater flow on the central and eastern portions of the KJG property is to the northeast and east toward Grace Christian. On the far west side of the KJG property the direction of groundwater flow is likely to the west.

On April 29, 2016, samples of the sub-slab vapor were collected from below the car wash building (sample VP-1 and VP-2) and the gas station building (samples VP-3 and VP-4). Samples were collected by installing two vapor pins in the concrete floor of each building and connecting a summa canister to each vapor pin. The collection rate of the summa canisters was regulated to allow the summa canister to collect a vapor sample over 30 minutes. The summa canisters were shipped to Pace Analytical for analysis for USEPA Method TO-15. The results of the laboratory analysis are summarized in **Table 3** and included in **Appendix B**. Petroleum compounds were detected in the sub-slab vapor samples; however, the concentrations were well below WDNR vapor risk screening levels (VRSLs).

3.0 REMEDIAL ACTIONS

The approved RAOR identifies the following remedial actions:

- Grace Christian Building – Soil excavation and expanded basement sub-slab venting system
- PSK Property – Soil vapor extraction
- PSK Property – Installing groundwater sump

The following sections provide a description of the proposed design of each remedial action. Drawings of the proposed remedial actions are included as **Figures 2** through **5**. Where applicable, technical specifications for the proposed remedial actions are presented on the drawings.

3.1 GRACE CHRISTIAN BUILDING SOIL EXCAVATION AND EXPANDED BASEMENT SUB-SLAB VENTING SYSTEM

Impacted soil excavation and landfill disposal will be performed to reduce the quantity of residual contamination under the Grace Christian building, and the basement sub-slab venting system will be expanded to increase the existing basement sub-slab vent system's area of influence.

Prior to starting the excavation work, the existing perimeter drain tile and basement sub-slab venting systems will be temporarily shut down. An approximately 18-foot by 11-foot area of the concrete basement floor of the Grace Christian building will be saw cut and the concrete

removed. The area of the soil excavation is shown on **Figure 4**. Soil within the excavation will be removed to a depth of approximately 2 feet below the top of the concrete slab, and the soil hauled off-site for landfill disposal. Soil samples will be collected from the sidewalls and base of the excavation to document the level of contamination remaining after excavation is complete. Samples will be analyzed for PVOCs and naphthalene. The excavation will remove approximately 20 tons of petroleum-impacted soil.

After excavation and soil documentation sampling is complete, the basement sub-slab ventilation system perforated piping will be extended into the area of excavation as shown on **Figure 4**. The excavation will be backfilled with pea gravel to a depth of 5 inches below the finished floor. After installation of the pea gravel, a vapor barrier will be installed on top of the pea gravel to prevent vapors from entering the building. The vapor barrier will be installed consistent with *ASTM E 1643 - Standard Practice for Installation of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs*. The vapor barrier will be a material specifically designed for use as a vapor barrier, such as Raven Industries, Inc., VaporBlock VB10 or similar.

Once the vapor barrier is installed, a 4- to 5-inch-thick concrete slab with wire mesh reinforcement will be poured to be level with the surrounding sub-tile basement concrete finished floor. The tile floor will be replaced after the concrete slab has set. Vacuum sampling points will be installed in the floor. The proposed locations of the vacuum sampling points are shown on **Figure 4**.

The expanded basement sub-slab ventilation system will be connected to the existing basement sub-slab blower system and the system will be re-started. Sub-slab pressure measurements from the existing sampling points will be used to evaluate the performance of the system.

Soil generated from excavation in the Grace Christian basement will be handled as contaminated soil in accordance with the Material Management Plan included in **Appendix C**.

Samples will be collected from the expanded basement sub-slab ventilation system exhaust to determine if an air permit is necessary for operation of the system. Sample results will be submitted to the WDNR and, as appropriate, an air permit application will be prepared.

Excavated soil will be placed in a roll-off container and soil samples obtained for laboratory analysis. Once the analytical results are obtained, the results will be submitted to a solid waste landfill for approval to dispose the soil at a landfill.

3.2 SOIL VAPOR EXTRACTION

A soil vapor extraction system will be installed in an area of residual soil and groundwater contamination on the PSK property located north of the USTs and beneath the sidewalk north of the car wash building in the utility corridor. The soil vapor extraction (SVE) system will serve to remove contaminant mass in the unsaturated zone in these areas, to increase the attenuation capacity of the soil, and potentially decrease the leaching of contaminants from soil to groundwater.

Monitoring well MW-21 will be modified to serve as a joint soil vapor extraction well (MW21/SVE-2) and a groundwater monitoring well. Well MW-21 is located north of the car wash building in the sidewalk along Sarasota Place. MW-21 has a 2-inch-diameter PVC casing and well screen that extends from 5 feet bgs to 15 feet bgs. The existing sidewalk will be removed around the well and soil excavated to expose the 2-inch PVC casing. A 2-inch PVC tee fitting will be installed on the casing at a depth of 3 feet bgs. A 2-inch PVC horizontal pipe will be installed to the tee fitting and run to the foundation of the car wash building, where a 2-inch PVC 90° elbow will be added and the piping run vertically along the outside of the building to the roof. Piping will run aboveground along the wall of the car wash building to a small enclosure located near the northwest corner of the car wash building. An explosion-proof electric blower will be installed to remove soil vapors from the subsurface around MW-21/SVE-2.

At the monitoring well, a 2-inch PVC vertical pipe will be added to the top of the tee fitting. An expandable well plug will be used to seal the well. The well cover and the concrete sidewalk will be restored. This modification will allow MW-21/SVE-2 to continue to be used for groundwater sampling, as needed. A drawing showing the modification to MW-21 is included on **Figure 5**.

Proposed soil vapor extraction well SVE-1 will be located in the northwest corner of the site in an area of residual impacts. SVE-1 will be installed using conventional drilling equipment and will extend to a depth of 15 feet bgs. The well will be made of 3-inch-diameter PVC and will have a 10-foot well screen. The well will be finished with a flush-mount well cover and a PVC tee fitting. PVC piping will be installed underground from the tee fittings at SVE-1 to a small enclosure located near the northwest corner of the car wash building. The SVE piping will run horizontally to an enclosure, and an SVE blower for each SVE well located within a single enclosure located in the landscaped area near the northeast corner of the car wash building.

Samples will be collected from the soil vapor extraction system exhaust to determine if an air permit is necessary for operation of the system. Sample results will be submitted to the WDNR and as appropriate, an air permit application will be prepared.

Soil generated from installation of the soil vapor extraction system will be handled in accordance with the Material Management Plan included in **Appendix C**.

3.3 GROUNDWATER SUMP

A groundwater sump will be installed in the northeast corner of the PSK property, approximately 10 feet west of monitoring well MW-1 (see **Figure 2**), which can be used to remove product and/or contaminated groundwater in the event of a future significant product release at the gasoline station. This location is within the area excavated during the 1997-1998 soil excavation, and backfilled with coarse-grained material. The depth of excavation in this area was approximately 15 feet bgs. The sump will be constructed to a depth of approximately 20 feet bgs.

The groundwater sump will be installed using conventional drilling equipment and will consist of 8-inch-diameter, Schedule 80 PVC well casing and screen. The sump will be constructed with solid pipe from the surface to a depth of 5 feet bgs, well screened to 16 feet bgs, followed by

4 feet of solid pipe to create a sump for installing a pump, if needed. The sump will be finished at the surface with a 12-inch-diameter, flush-mount well cover. A drawing showing the proposed groundwater sump is included on **Figure 6**.

Soil generated from installation of the groundwater sump will be handled in accordance with the Material Management Plan included in **Appendix C**.

4.0 PUBLIC HEALTH AND ENVIRONMENTAL LAWS AND STANDARDS

A project-specific health and safety plan will be prepared to address construction activities and chemical hazards. The proposed basement sub-slab ventilation system is a mitigation system designed to depressurize the sub-slab and prevent potential migration of sub-slab vapors into indoor air. The mitigation is regulated under NR 700 standards. The system will be maintained until sub-slab vapor sample results show there is no longer a potential for vapor intrusion and will not be shut down without prior approval from the WDNR.

Permits required for construction of the SVE system include a building permit and an air discharge permit.

5.0 LONG-TERM MONITORING

5.1 GROUNDWATER MONITORING

Two quarterly rounds of post-excavation groundwater samples will be obtained from monitoring wells MW-1, MW-2, MW-3, MW-5, MW-7, MW-20, MW-21, and the existing extraction well/sump to determine if groundwater concentrations continue to be stable or decreasing and if monitoring can be discontinued.

5.2 SOIL VAPOR MONITORING

The soil vapor extraction system at wells MW-21/SVE-2 and SVE-1 will have separate blowers. Samples from the exhaust of the blowers will be obtained for analysis for VOCs. Sampling will be consistent with the WDNR *Guidance for Design, Installation, and Operation of Soil Venting Systems* (WDNR PUB-RR-185) dated June 2002. System exhaust sampling and negative pressure measurements will be performed daily for the first 3 days of operation, weekly for the next 3 weeks, then monthly. Samples will be obtained using a sampling pump and carbon tubes. Samples will be analyzed for VOCs. The flow rate of the system will also be measured at the same frequency. To assess sub-surface vacuum distribution, vacuum measurements will be made at existing vapor probes (VP-1 through VP-4) and monitoring wells MW-1, MW-2, MW-3, MW-7, MW-20, MW-21/SVE-2, and SVE-1, as appropriate for measuring the area of influence.

After 6 months of operation and sampling, the monitoring frequency of the soil vapor extraction system will be reviewed to determine if additional sampling is required. The WDNR Remediation Site Operation, Maintenance, Monitoring & Optimization Report (Form 4400-194)

will be completed for the soil vapor extraction system at wells MW-21 and SVE-1 and submitted to the WDNR. The total mass of the gasoline range organics extracted from the SVE system will be calculated over time. When the rate of contaminant mass removal diminishes, or plateaus, the system will be considered for shut down, subject to WDNR approval.

Both of the venting systems at Grace Christian will continue to operate. One sample of the exhaust gas from the perimeter drain tile venting system and the basement sub-slab venting system will be obtained for analysis of VOCs.

The Grace Christian basement sub-slab system currently has a manometer on the exhaust stack to measure the vacuum of the system. This manometer will continue to be used to monitor the basement sub-slab system quarterly and ensure there is a vacuum below the concrete slab.

6.0 PLANNED OPERATION AND MAINTENANCE

The Grace Christian perimeter drain tile and basement sub-slab venting systems and the PSK soil vapor extraction system will be operated until exhaust monitoring indicates the systems are no longer needed. Exhaust sampling and/or vacuum monitoring will be conducted as discussed in Section 5.2

A construction documentation report with a maintenance plan for the Grace Christian basement sub-slab venting system will be submitted to the WDNR for approval after the completion of construction.

PSK will be responsible for operation and maintenance (O&M) of the soil vapor extraction system at MW-21/SVE-2 and SVE-1, and Grace Christian will be responsible for the O&M of the perimeter drain tile and expanded basement sub-slab venting systems at Grace Christian.

7.0 SCHEDULE

The following schedule is approximate and shows estimated project milestones. The actual schedule may vary due to WDNR schedule conflicts, weather delays, and other unpredictable events.

Task	Estimated Completion Date
Submittal of Design Report	September 2016
WDNR Review and Approval of Design Report	November 2016
PECFA Budget Approval	Late 2016 / Early 2017
Contracting	Late 2016 / Early 2017
Groundwater Sump Installation	2017
SVE System Installation	2017
Grace Christian Basement Sub-Slab Ventilation System	2017

Abbreviations:

µg/L = micrograms per liter or parts per billion (ppb)

TMBs = 1,2,4- and 1,3,5-trimethylbenzenes

NA = Not Analyzed

(Dup) = Duplicate Sample

GRO = Gasoline Range Organics

VOCs = Volatile Organic Compounds

NE = No Standard Established

Notes:

NR 140 ESs - Wisconsin Administrative Code (WAC), Chapter NR 140.10 Table 1 - Public Health Groundwater Quality Standards from January 2012.

NR 140 PALs - WAC, Chapter NR 140.10 Table 1 - Public Health Groundwater Quality Standards from January 2012.

Bold+underlined values meet or exceed NR 140 enforcement standards.

Italic+underlined values meet or exceed NR 140 preventive action limits.

This table is adapted from previous reports by OM Enterprises. SCS Engineers results are for the 3/15/16 and later results (if present).

Table 3. Sub-Slab Vapor Analytical Results Summary
PSK Investments LLC, Milwaukee, WI / SCS Engineers Project #25216050.00
 (Results are in ppbV, except where otherwise noted)

Sample	Date	Lab Notes	PID (ppb)	1,2,4-Trimethylbenzene	1,3,5-Trimethylbenzene	Benzene	Ethylbenzene	m&p-Xylene	Methyl-tert-butyl ether	Naphthalene	o-Xylene	Toluene
VP-1	4/29/2016	--	84	1.5	0.74 J	1.4	1.3	3.5	<0.13	1.3 J	1.1	8.7
VP-2	4/29/2016	--	184	1.6	0.74 J	0.86	1.5	2.7	<0.14	1.5 J	1.1	3.7
VP-3	4/29/2016	--	21	1.1	0.62 J	0.55	0.57	2	<0.14	1.4 J	0.68	2.8
VP-4	4/29/2016	--	205	2	0.82 J	0.23 J	1.1	3.6	<0.14	1.7 J	1.2	2.3
Vapor Risk Screening Level (Small Commercial Building)				210	NE	160	370	3,300	4,300	23	3,300	190,000

Abbreviations:

ppbV = parts per billion by volume
 -- = not applicable

NE = not established
 PID = photoionization detector

ppm = parts per billion

Notes:

1. Samples were collected in 6-liter summa canisters over a 30-minute period and analyzed using the USEPA TO-15 analytical method.
2. Vapor Risk Screening Levels from Wisconsin Department of Natural Resources Quick Look-Up Table dated December 2015.
3. **Bold+underlined** values meet or exceed Vapor Risk Screening Levels.

Lab Notes/Qualifiers:

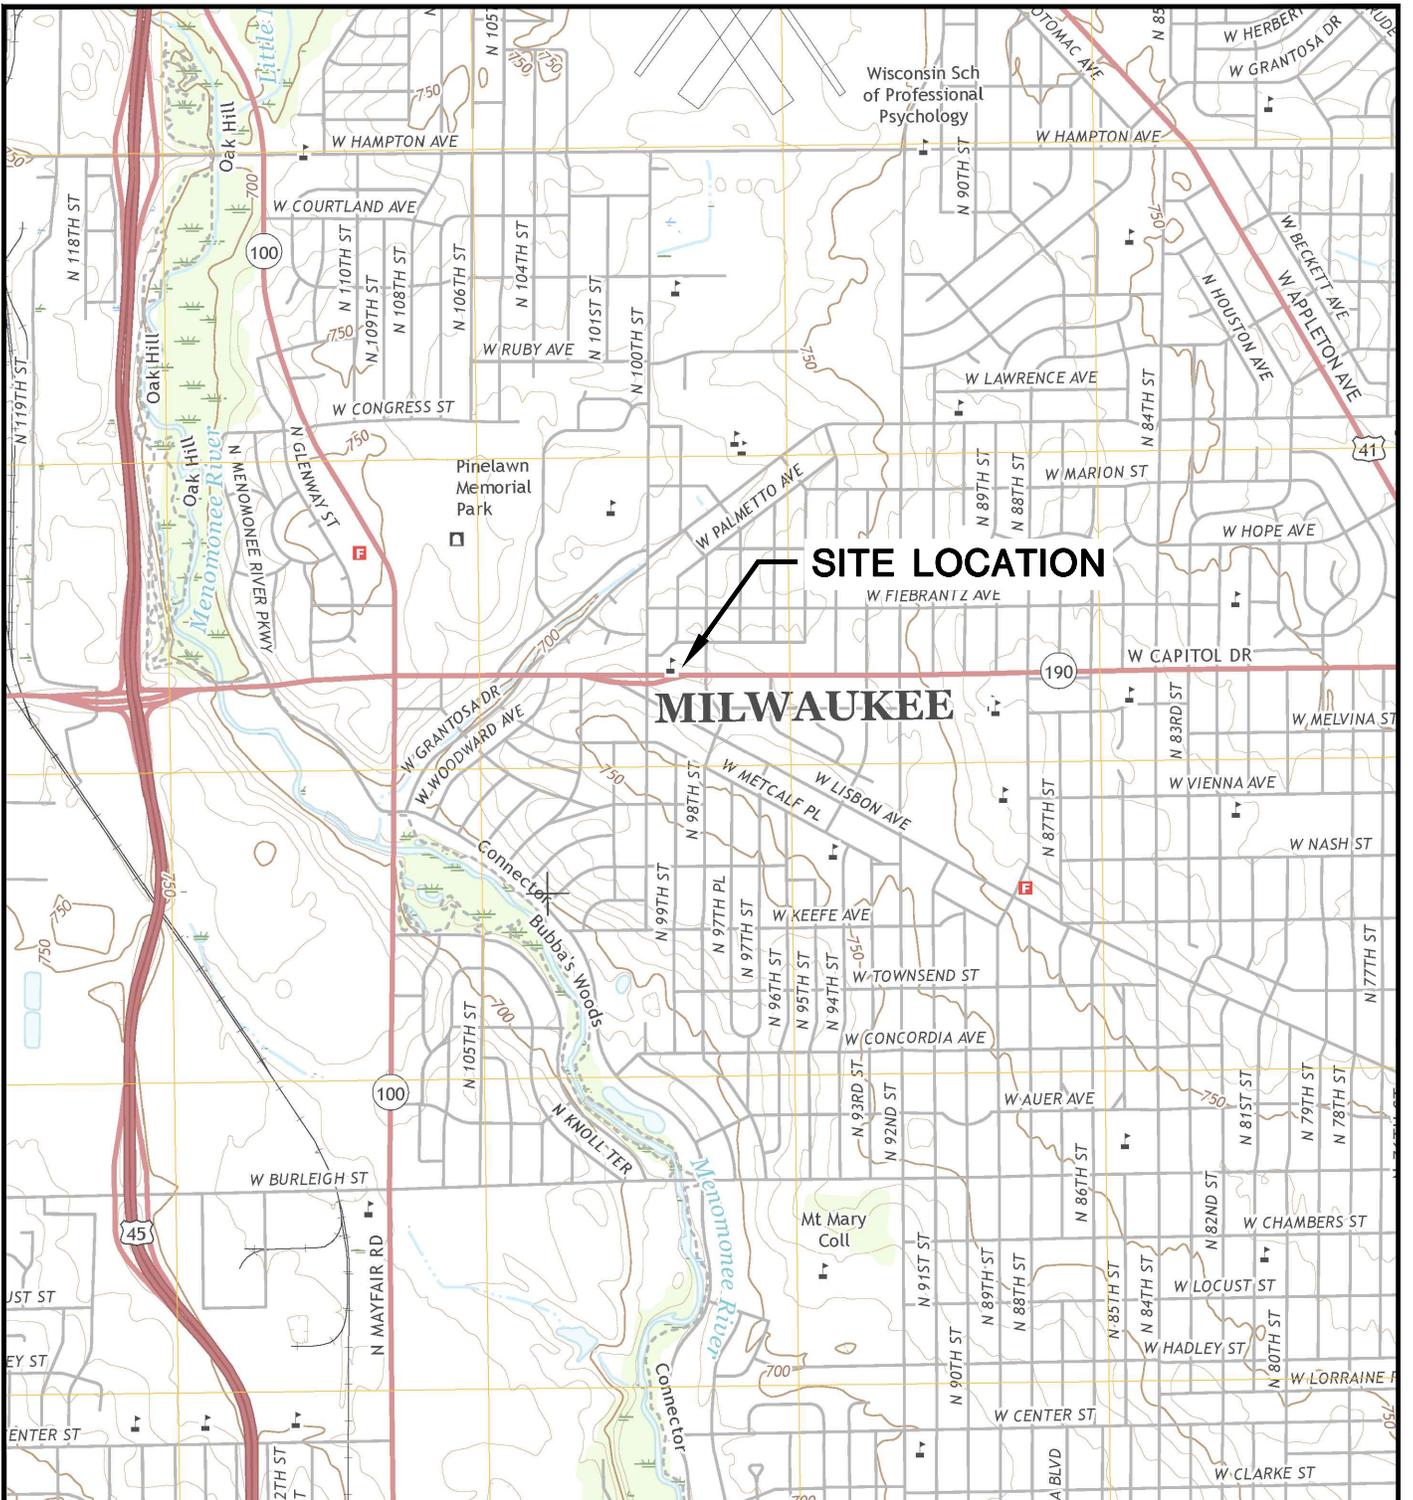

J = Estimated concentration at or above the Limit of Detection and below the Limit of Quantitation.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments

No additional comments.

Receipt

The samples were received on 3/16/2016 9:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.9° C.

GC VOA

Method(s) WI-GRO: Surrogate recovery for the following samples was outside control limits: MW-3 (500-108855-8) and MW-20 (500-108855-14). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) WI-GRO: The following sample(s) were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: MW-1 (500-108855-2), MW-7 (500-108855-10), MW-9 (500-108855-12) and MW-20 (500-108855-14).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

2. Temperature of rep. sample or temp blank when opened: 02 Degrees Celsius

3. If Item #2 temperature is 0°C or less, was the representative sample or temp blank frozen? YES NO NA

4. Were custody seals on outside of cooler? YES...NO...NA

If yes, how many and where: 1) Front

5. Were the seals intact, signed, and dated correctly? YES...NO...NA

6. Were custody papers inside cooler? YES...NO...NA

I certify that I opened the cooler and answered questions 1-6 (initial) msm

7. Were custody seals on containers: YES NO and Intact YES...NO...NA

Were these signed and dated correctly? YES...NO...NA

8. Packing mat'l used? Bubblewrap Plastic bag Peanuts Vermiculite Foam Insert Paper Other None

9. Cooling process: Ice Ice-pack Ice (direct contact) Dry ice Other None

10. Did all containers arrive in good condition (unbroken)? YES...NO...NA

11. Were all container labels complete (#, date, signed, pres., etc)? YES...NO...NA

12. Did all container labels and tags agree with custody papers? YES...NO...NA

13a. Were VOA vials received? YES...NO...NA

b. Was there any observable headspace present in any VOA vial? YES...NO...NA

14. Was there a Trip Blank in this cooler? YES...NO...NA If multiple coolers, sequence # 3

I certify that I unloaded the cooler and answered questions 7-14 (initial) sew

15a. On pres'd bottles, did pH test strips suggest preservation reached the correct pH level? YES...NO...NA

b. Did the bottle labels indicate that the correct preservatives were used YES...NO...NA

16. Was residual chlorine present? YES...NO...NA

I certify that I checked for chlorine and pH as per SOP and answered questions 15-16 (initial) sew

17. Were custody papers properly filled out (ink, signed, etc)? YES...NO...NA

18. Did you sign the custody papers in the appropriate place? YES...NO...NA

19. Were correct containers used for the analysis requested? YES...NO...NA

20. Was sufficient amount of sample sent in each container? YES...NO...NA

I certify that I entered this project into LIMS and answered questions 17-20 (initial) sew

I certify that I attached a label with the unique LIMS number to each container (initial) sew

21. Were there Non-Conformance issues at login? YES...NO Was a NCM generated? YES...NO...#

Creator: Kelsey, Shawn M

Question	Answer	Comment
Radioactivity wasn't checked or is \leq background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.9c
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

RE: Project: 25216050 PSK Investments LLC
Pace Project No.: 10346794

Dear Rob Langdon:

Enclosed are the analytical results for sample(s) received by the laboratory on May 02, 2016. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Carolynne Trout

QUALIFIERS

Project: 25216050 PSK Investments LLC

Pace Project No.: 10346794

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above LOD.

J - Estimated concentration at or above the LOD and below the LOQ.

LOD - Limit of Detection adjusted for dilution factor and percent moisture.

LOQ - Limit of Quantitation adjusted for dilution factor and percent moisture.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected at or above the adjusted LOD.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

1.0 INTRODUCTION

This Material Management Plan (Plan) provides guidance for the management of contaminated materials encountered during soil remediation activities at the PSK Investments (PSK) and Grace Christian Fellowship Properties (Grace Christian) facilities. The site is located at 9922 and 9900 West Capital Drive, Milwaukee, Wisconsin (**Figure 1**).

Petroleum compounds have been documented in soil and groundwater at the PSK and Grace Christian properties in the vicinity of the proposed groundwater sump, soil vapor extraction system, and the Grace Christian basement excavation. The proposed remediation work is detailed in the April 9, 2014 Revised Remedial Action Options Report (RAOR), prepared by SCS Engineers (SCS) and involves the following:

- Grace Christian Building – Soil excavation and expanded sub-slab venting system
- PSK Property – Soil vapor extraction
- PSK Property – Installation of groundwater sump

The Wisconsin Department of Natural Resources (WDNR) approved the proposed remediation work in a letter dated June 1, 2015.

2.0 BACKGROUND INFORMATION

Background information on the properties is included in the Design Report.

3.0 HEALTH AND SAFETY

All contractors working on the storm sewer project must develop a site-specific health and safety plan for their staff to address chemical and physical hazards, and their staff must have 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) training.

4.0 REMEDIAL ACTIVITIES

The proposed remedial actions are shown on Figure 2 of the September 2016 Design Report prepared by SCS. Work includes the following:

- Installation of a groundwater sump in the parking lot of the service station
- Conversion of monitoring well MW-21 into a combination groundwater monitoring well and a soil vapor extraction well (MW-21/SVE-2)
- Installation of soil vapor extraction well SVE-1
- Installation of the soil vapor extraction piping to MW-21/SVE-2 and SVE-1 and the SVE blowers
- Excavation and landfill disposal of impacted soil from the basement of the Grace building
- Extension of the existing sub-slab venting system in the Grace building

5.0 MATERIAL MANAGEMENT

All of the remedial activities at the site will produce soil that has been impacted by contaminated soil. Management of petroleum-impacted material during construction activities is described in the following section.

5.1 SOIL MANAGEMENT

In general, soils to be excavated as part of the remediation activities will be taken off site for landfill disposal. Contaminated soil will be transported to an approved landfill by a licensed hauler.

6.0 UNUSUAL CONDITIONS

If any tanks, unusual odors, staining, fluids, or piping are found during construction activities, work will stop in that area, the contractor will notify the owner of the conditions, and SCS will inspect the site to assess the situation.

If contaminated material is encountered that is significantly different than what has been previously identified, it will be evaluated by SCS, and appropriate management activities will be conducted.

7.0 ROLES AND RESPONSIBILITIES DURING CONSTRUCTION

The following roles and responsibilities have been identified for the project:

Owner or Construction Manager/Owner's Agent

- Performs overall project scheduling and retains environmental consultants and contractor

Environmental Consultant

- Obtains soil profile approval for landfill disposal
- Provides on-site observation and documentation during management of materials
- Manages special or unanticipated environmental conditions encountered during construction

Contractor

- Performs work in accordance with the project construction plans and specifications

- Arranges for storage and transport of contaminated soils to the licensed landfill identified by the Environmental Consultant

8.0 REPORTING

Upon completion of all activities, SCS will provide a written report and documentation of the activities and disposal methods to the WDNR.
