Hi OJ,

I just talked with our VI team and have attached a map with approximate proposed sampling locations that would allow EPA and WDNR to clear both buildings if new samples come back below screening levels. We came up with 25 new subslab sampling points and 4 soil borings across the two buildings. Our next monthly call will be a good opportunity to discuss this proposed plan and other ongoing elements at the Site. Feel free to reach out if you have any questions in the meantime.

Best,
Jeff D.

All,

I confirmed that the DNR would want to apply the soil standards identified in the DNR RCL Spreadsheet (discussed during am meeting), which are based on a 10^{-6} excess cancer risk and hazard index of 1. We also agree with EPA that the most stringent standards, whether they are EPA or DNR, would be appropriate.

Thanks

We are committed to service excellence.

Jeff-

Thank you for providing this information.

Hi All,

As per our discussion today, I've attached EPA's residential soil UU/UE numbers, which are based on a 10^{-6} lifetime cancer risk OR hazard index of 1 depending on which is more stringent, for all contaminants and highlighted PCE, TCE, and DCE. The RSL calculator was used on November 2023, but should be up to date for all of the contaminants found in the Site's RI that could be above UU/UE. As far as which contaminants to use in the UFP-QAPP, please use those contaminants listed in the SVE cleanup table for now. Also to reiterate, whatever legal standards Jeff P. sends will likely be appropriate if they are more stringent than EPA's standards, but this might not be the case for UU/UE determination.

Let me know if you have any questions about the table.

Best,
Jeff D.
