Lake Management Best Practices (Healthy Lakes Initiative)

The Healthy Lakes Initiative is a program that has been set up by the WDNR to provide support through information and grant funding to small scale projects that will help improve both shoreline habitat and lake health. The grants available for these projects are intended for fairly small, inexpensive projects, so there is a \$1000 limit in grant funding per project. This program is focused on helping individual property owners improve their shoreline. There are five projects that are eligible for Healthy Lakes Grants. The projects that qualify for these grants are installing fish sticks, rain gardens, native plantings, diversions, and rock infiltrations.

Fish sticks (Figure 2) is taking trees from inland, and installing them in the lake to mimic shore trees that will eventually fall into the lake. The trees used must be taken from a minimum of 35 feet inland and are then secured to the shore with cables for approximately 3 years. This provides habitat for fish, birds, and many other animals. In addition to providing habitat, fish sticks help protect the shoreline from bank erosion. Fish sticks project costs range anywhere from \$100 to \$1000, averaging about \$500. These are very low maintenance because it is only necessary to occasionally check the cables to ensure they are secure. This practice would work well for almost any of the developed parcels on the flowage.

Figure 2: Fishsticks installation (left) and after ice out (right).

Rain gardens (Figure 3) are shallow depressions that contain loose soil and native plants. These are intended to capture the runoff, allowing the water to be filtered, naturally through the ground instead of flowing directly into the lake. Rain gardens are designed to allow the rainwater to soak into the ground with 1-2 days, to prevent any of the issues created by standing water. The project cost for rain garden range anywhere from \$500 to \$9,500, but this is very dependent on the size of the rain garden. The maintenance is fairly low, only requiring watering for about two weeks, until the plants have established, and weeding is occasionally needed during the first year. This project is best suited to parcels on a smaller incline to catch rainwater runoff that would otherwise run into the lake.

Figure 3: Rain Garden Installation (Left) and Upon Completion (Right)

Native plantings (Figure 4) are intended to establish a buffer zone between the developed portion of a parcel and the lake. The buffer helps filter and slow rainwater runoff so much of it filters into the ground. This buffer zone is created by changing a strip of turf grass, at least ten feet wide, along the shoreline to a natural area composed of native shoreline plants. Similar to rain gardens, these are fairly low maintenance requiring water only until the plants have become established. The only ongoing maintenance is the removal of any invasive species that find their way into the planting. On average, native plantings cost around \$1000. This project will work for almost any developed parcel that does not have a sand beach as the primary frontage.

Figure 4: Completed Native Planting (Photo from HealthyLakesWI.com)

Diversions (Figure 5) are placed across a sloping path or driveway to divert runoff water to an area where it can be absorbed into the ground instead of flowing directly into the lake. In addition to helping improve lake health, these can also reduce the effects of erosion on the paths that the diversions are installed on. Diversions are created by entrenching a log or creating a small earthen berm approximately 30 degrees from the angle of the slope. The cost

of these range anywhere from \$25 to \$3,750, but the average diversion costs \$200. These are very low maintenance, and only require some debris removal that could get stuck in the diversion and occasionally ensuring everything is still secure and in place. This practice does not work well for the purposes of this particular survey, but it is mentioned here as a nod to projects that could be completed further inland than this survey was meant to assess.

Figure 5: Completed Diversion (Photo from *HealthyLakesWI.com*)

Rock infiltrations (Figure 6) are meant for relatively low traffic areas as a way to catch rainwater runoff and divert it into the ground. These consist of a pit which is no more than five feet deep. This pit is lined with filter fabric and filled with small rock. More filter fabric is placed on top and larger rock is then placed over that to hold everything in place. These range in price from \$500 to \$9,500, on average costing \$3800. This requires some maintenance to function properly. It is necessary to remove any debris such as leaves or pine needles that may collect. It is also necessary to occasionally clean out the rock as it collects sediment. This works well around building that can be seen in the riparian zone. The rock infiltrations allow for rainwater coming off of the roof to be collected and filtered without damaging the building it surrounds.

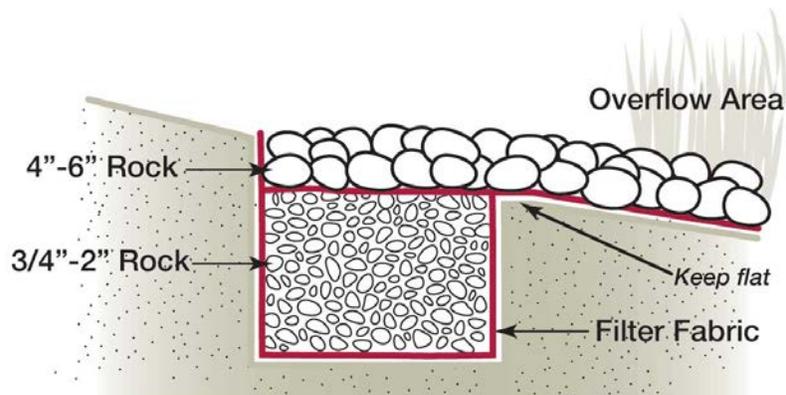

Figure 6: Rock Infiltration Set-up

Example Parcels (Not From Granite Lake)

These parcels are simply meant to give property owners an idea of property owners who are able to make the most of their lakefront property while still having very little negative impact on the lake itself.

Figure 7: Developed Parcels with a "No Priority" Ranking

The properties shown in Figure 7 have been assessed with the same protocol as the properties surrounding Granite Lake, and have received priority rankings of 'None.' Each property is a little different, but in each parcel, the majority of the land within the riparian zone is comprised of undisturbed, native vegetation. The parcels that are level have some manicured lawn within that zone, but this is treated more like a well-maintained trail. For parcels with a steep slope, having a trail or stairway down to the lake while leaving the rest of the area as native vegetation works best. Not only is this the most lake-friendly approach, but the maintenance and general upkeep of this area becomes much safer, easier, and cost effective.

Alphabetical Index of Parcel Numbers and Owners

PARCEL ID	OWNER	CO-OWNER
0264-0220-5000	AARON R & ERIN G LEHMANN	
0264-0001-3000	AARON R & ERIN G LEHMANN
