Water Quality Classification At Vitamin Products Company, Brookfield

On April 27, 1978, Ric Johnson of our Water Quality Section visited the above referenced facility for the purpose of evaluating the wastewater disposal area in accordance with the stream classification system in NR104. Ric found that the effluent from the last stabilization pond flows a short distance through a poorly defined channel in a wetland area before entering the Fox River approximately one mile upstream of the Brookfield Wastewater Treatment Plant. The Fox River at this point flows through predominantly agricultural lands which are becoming increasingly urbanized. The fishery of the Fox River in this section includes a number of game and forage species.

Ric recommended that the effluent disposal area be classified as a wetland. The Fox River at this point is classified as a continuous fish and aquatic life stream.
