Proposed Discharge from Fromm Labs

The receiving stream for the proposed Fromm Labs Wastewater Treatment Facility is a non-continuous tributary of Lake Michigan. The land use within the drainage area is predominantly agricultural, but also includes residential and commercial (Fromm Labs) development. The land adjacent to the stream is densely wooded. Extensive dumping of ferrous wastes onto the bed of the tributary have occurred in the past. The tributary substrate is predominantly sand.

Recommendations

The tributary shall be classified as a non-continuous marginal stream.
