Project Overview

NES Ecological Services (NES) – A Division of Robert E. Lee and Associates, Inc. (REL), was contracted by the City of Marinette to provide vegetation monitoring services at Menekaunee Harbor located in Sections 4 & 9, T30N, R24E, City of Marinette, Marinette County, Wisconsin (Figure 1). The City began restoration at Menekaunee Harbor (herein referred to as the “Harbor”) as part of a Great Lakes Restoration Initiative (GLRI) Grant to restore the Lower Menominee River Area of Concern (AOC). In the summer of 2015 NES/REL finalized a Restoration Plan for the Harbor and the Quality Assurance Project Plan (QAPP) was signed in October 2015. The Project area is approximately 16.77 acres in size and is designed to encompass 1.0 acre of emergent aquatic, 1.07 acres of emergent aquatic – wild rice (redefined in 2017 due to higher water levels), 0.05 acres of ephemeral pool, 0.32 acres of mesic to wet-mesic prairie, 0.82 acres of northern sedge meadow, 1.22 acres of wet mesic forest, 4.07 acres of open water (redefined in 2017 due to higher water levels), 0.32 acres of prairie, 0.51 acres of shrub-carr and 0.03 acres of submergent aquatic. Additional areas were added (0.06 acres of emergent/wet meadow, 0.22 acres of shady woodland and 7.08 acres of invasive species control) to the project site towards the end of the 2016 growing season due to acquiring additional funding (Figure 2).

NES ecologists conducted the third year of monitoring on June 20th, August 30th and September 6th, 2018. An additional trip was made on December 10th to survey the microhabitat structures (bat houses, osprey nesting platform, screech owl nest boxes, tree swallow/eastern bluebird boxes & wood duck boxes). The completion and submittal of this monitoring report (Year 3), satisfies the requirements outlined in the QAPP. Report submittals are required for three consecutive post-construction growing seasons.

Goals, Objectives & Performance Standards

Goals

The purpose of the Menekaunee Harbor ecological restoration is to restore native vegetation and habitat within a degraded wetland complex. Per the QAPP, the goals of the site are as follows:

- Long-term protection is in place for natural areas and wetlands within the AOC.
- Nesting populations of a diverse array of wetland-dependent and riparian-associated birds are consistently present within the AOC.
- The lake sturgeon (*Acipenser fulvescens*) population is enhanced.
- Diverse and functional native fish and mussel assemblages are present in the AOC that sustain natural recruitment.
- A healthy and diverse native vegetation community has been restored.

Objectives

In support of these goals, the objectives and related target criteria of this restoration are as follows:

1. Restore benthic habitats for use by invertebrates and native fish species, which historically utilized the harbor including: walleye (*Sander vitreus*), yellow perch (*Perca flavescens*), muskellunge (*Esox masquinongy*), smallmouth bass (*Micropterus dolomieu*), largemouth bass (*Micropterus salmoides*), northern pike (*Esox lucius*), and bluegill (*Lepomis macrochirus*).
 - a) Eliminate contaminated sediments and establish water depths averaging 6-7 feet.
 - b) Install fish sticks, log structures, woody debris and rock structures to increase cover

- and feeding opportunities.
- c) Establish small populations of submergent native vegetation in the harbor.
 - d) Eliminate and control invasive species within emergent aquatic communities, while establishing native plants to provide spawning habitat.
2. Establish healthy and diverse native vegetation communities.
 - a) Restore/create community types found to be high priority communities within the Northern Lake Michigan Coastal Ecological Landscape.
 - b) Install a variety of ferns, grasses, sedges, forbs, shrubs, and trees currently and historically found within Marinette County. Wild rice (*Zizania palustris*) was historically found within the Menominee River; therefore, an attempt will be made to re-establish a viable population.
 - c) Increase plant diversity by adding a few species typically found more often within southern Wisconsin to account for temperature increases due to global climate shifts.
 - d) Absolute cover of invasive species will be < 15% within each community type.
 3. Restore wetland and upland habitat for use by invertebrates, amphibians, reptiles, mammals and birds.
 - a) Native vegetation capable of providing a variety of food and cover will be established throughout the restored/created communities.
 - b) Existing snags will be left and protected to provide food sources and potential future nesting sites.
 - c) Rock and brush piles will be added to provide cover.
 - d) Downed woody debris will be placed in the emergent aquatic and wet meadow communities to provide sites for loafing and basking.
 - e) Nesting boxes and platforms will be installed to increase suitable nesting sites.
 - f) Bat houses will be erected to provide roosting sites.

Over the course of the monitoring period it is expected that site functions will improve in all of the above categories.

Ecological Performance Standards

Performance standards are the measures utilized to determine whether desired objectives regarding the overall mitigation goal have been met. Post-construction monitoring activities are performed throughout the duration of a project to evaluate progress toward achieving the functional objectives. The below performance standards in Table 1, as outlined in the approved QAPP, will be used to verify the success of the emergent aquatic, emergent aquatic- wild rice, open water & submergent aquatic, ephemeral pool, mesic to wet mesic prairie & prairie, northern sedge meadow, wet mesic forest, and shrub-carr communities.

Table 1. Status of Ecological Performance Standard Achievement

Ecological Performance Standards (PS) For Year Two	PS Achievement			Monitoring Results			Discussion of Monitoring Results/Trends	
	2016	2017	2018					
Aerial coverage of invasive, non-native species such as giant reed grass, reed canary grass, cattail spp., purple loosestrife and spotted knapweed will not be >5% after two years.	Y	Y	Y	Invasive, non-native species	% Cover	% Relative Cover	The five main invasive species of concern currently have <5% total coverage within the project area.	
Giant reed grass				0.125	0.08			
Reed canary grass				0.89	0.60			
Cattail spp.				0.63	0.42			
Purple loosestrife				0.63	0.42			
Spotted knapweed				0.22	0.15			
After two years, >80% of the vegetative cover within the restoration site will be native species, <20% of the cover will be invasive, non-native species.	Y	Y	Y	Species	Percent cover		Vegetative cover is currently exceeding the 80% minimum native species cover after three years. <i>Calamagrostis canadensis</i> (blue-joint grass), <i>Elodea canadensis</i> (Canadian waterweed), a submergent aquatic, <i>Schoenoplectus tabernaemontani</i> (soft-stem bulrush) and <i>Acer negundo</i> (box elder) are accounting for the largest portion of vegetative cover of native species with 10.18, 9.25, 5.38 & 5.30% relative cover, respectively.	
Native				89.51				
Invasive / Non-native				10.49				
Eighty five percent of the site will be vegetated within two years.	Y	Y	Y	Sum of average percent cover across the site = 148.60%			Based on the sum of average percent cover across all communities this criterion has been met. The lowest percent cover across all communities was the prairie at 119%.	
520 of the 650 planted shrubs within the Shrub-Carr community will be present and healthy two years after installation.	Y	IP	N	30 of 650 shrubs were present and healthy within the shrub-carr community. Shrub count was gathered by surveying a portion (0.24 acres) of the shrub-carr community then averaging that number across the entire community (0.51 acres) using the total number of shrubs installed (650).				
800 of the 1,000 planted trees and shrubs within the Wet Mesic Forest community will be present and healthy after two years of installation.	Y	IP	N	352 of 1,000 trees and shrubs were present and healthy within the wet mesic forest community. Tree and shrub count was gathered by surveying a portion (0.35 acres) of the wet mesic forest zone then averaging that number across the entire community (1.22 acres) using the total number of trees and shrubs installed (1,000).				
The Open Water with Submergent Vegetation community shall have a minimum of 5 native species present.	Y	Y	Y	This community had 14 native species identified during the vegetation survey				
The Emergent Aquatic, Northern Sedge Meadow, Shrub-Carr, Wet Mesic Forest and Mesic to Wet Mesic Prairie & Prairie communities shall each have a minimum of 15 native, non-invasive species present.	P	Y	Y	Community	Number of Native, Non-invasive Species		All communities for this performance standard currently meet the goal.	
Emergent Aquatic & Emergent Aquatic –Wild Rice				37				
Northern Sedge Meadow				47				
Shrub-Carr				52				
Wet-Mesic Forest, Ephemeral Pool & Mesic to Wet-Mesic Prairie				87				
Prairie				41				

Table 1. Continued

Ecological Performance Standards (PS) For Year Two	PS Achievement			Monitoring Results			Discussion of Monitoring Results/Trends	
	2016	2017	2018					
To ensure the restored communities have natural significance, the floristic quality index (FQI) and Coefficient of Conservatism (Mean C) for each shall be ≥ 22 and ≥ 3.8 , respectively, after two years. FQI values will be calculated utilizing all species present: non-native species will be assigned a value of zero.	P	P	P	Community	FQI	Mean C	The prairie & open water w/submergent veg communities have not met the criteria for this performance standard. However, the prairie did trend positively in regards to both FQI (13.42 to 15.90) and mean C (1.43 to 1.90) since 2017. Because this community was established from bare soil and seed it will take more time to become established. Although the prairie is not currently meeting the standard it is trending correctly and should meet the standard in the near future. The open water w/submergent veg stayed relatively the same regarding FQI and mean C since 2017 (21.00 to 19.51 & 5.25 to 5.21, respectively). The open water w/submergent veg community is only short of the FQI standard. The FQI is high however and should meet the standard soon.	
				Emergent Aquatic & Emergent Aquatic – Wild Rice	27.96	4.37		
				Northern Sedge Meadow	31.20	4.33		
				Shrub-Carr	32.32	4.28		
				Wet-Mesic Forest, Ephemeral Pool & Mesic to Wet-Mesic Prairie	38.69	3.89		
				Prairie	15.90	1.90		
				Open Water w/Submergent Veg	19.51	5.21		
Seven of the fifteen nesting and roosting structures shall be utilized or occupied annually by year three.	IP	IP	Y	7 tree swallow nest boxes, 2 screech owl nest boxes and 2 wood duck nest boxes were identified as utilized or occupied while 2 Bat houses, 1 wood duck box and the osprey platform were identified as not being utilized or occupied.				
Twenty avian species, five species of reptiles and amphibians, and five mammal species will be recorded, either through direct observation, calls or sign left by the species, utilizing the site after three years.	IP	IP	Y	Species Type	2016	2017	2018	Based on the information in Table 5 there were 23 different avian species, 5 different herptiles and 5 different mammals recorded over the 3 year monitoring period.
				Avian	9	9	15	
				Herptiles	3	3	4	
				Mammals	3	3	3	

NA = Not Applicable

IP = In Progress

P = Performance Standard is Partially Met

Y = Performance Standard is Met

Summary Data

Methods

Vegetation/Floristic Diversity

Meander surveys (Figure 3) were conducted within the project area to gather a representative sample of the floristic diversity of each plant community. Surveys were completed between the months of June and September to compile a list of plant species and their associated coverages found within each community. A comprehensive species list of the entire site can be found in Appendix A.

In 2018 NES used the timed-meander sampling protocol for vegetation monitoring developed by the Wisconsin Department of Natural Resources (Appendix B). On June 20th, August 30th and September 6th timed meanders were conducted in the wet mesic forest, shrub-carr, emergent aquatic, emergent aquatic – wild rice, northern sedge meadow, submergent aquatic, open water, mesic to wet-mesic prairie, prairie, ephemeral pond and two newly added zones (shady woodland planting & emergent/wet meadow planting). Additionally, the invasive species control area was surveyed to document the presence and cover of invasive species within its boundaries.

Due to the similarity of species in the herbaceous layer and the wet mesic forest being in the early stages of development, NES combined the wet-mesic forest, ephemeral pool and mesic to wet-mesic prairie community data. Additionally, due to the similarity of species present the emergent aquatic and emergent aquatic – wild rice community data was also combined.

Results

Vegetation/Floristic Diversity

A list of species found during the meander surveys and a summary of each community type can be found in Appendix A. These data were used to compute the information reported in Table 2 below. A total of 237 plant species were recorded during the 2018 surveys.

Photos (Appendix C) documenting existing site conditions within each community type were taken throughout the site (Figure 3).

Native Species Dominance

All communities had a greater coverage of native plant species. Since 2017 there are an additional 76 native species and the percent native coverage has remained relatively the same across the entire site (91.39% in 2017 & 89.51% in 2018). All dominant species are native in each of the communities that were surveyed with the exception of the Emergent/Wet Meadow planting around the pond where one of the 13 dominant species was non-native (*Agrostis gigantea*). Table 3 contains a list of dominant species found within the Harbor communities. Additional information pertaining to the percent areal coverage of native and invasive species can be found in the community summary data (Appendix A).

Table 2. Vegetation Data Summary.

Invasive/Non-native Species

Based on the information in Table 4, there are currently 37 invasive and/or non-native species found across all communities with an overall coverage of 10.49%. The percent coverage of invasive species increased by 1.88% from 2017 to 2018. The increase in percent cover is not of great concern as this slight

jump could be accounted for within the margin of error from visual cover estimates from year to year. Please see the plot data sheets in Appendix A for specific sample plot percentages. Table 4 includes a list of all non-native species identified during plant surveys in 2018. Several of the species listed below often invade newly seeded sites such as the Prairie community which has the largest number of non-native species present; however, many of these biennial and perennial weeds quickly disappear with proper maintenance and native species establishment. Continued monitoring and management of non-native species will eliminate or suppress their threat to spread throughout the site.

Table 4. Invasive/Non-native Species Coverage (%).

American Robin	<i>Turdus migratorius</i>			
Mourning Dove	<i>Zenaida macroura</i>			

Conclusions & Recommendations

Overall, the condition of the Harbor three years after restoration is exceptional. All of the vegetation communities have greater than 90% native species coverage with the exception of the emergent/wet meadow planting (86.09%) and the prairie (75.63%). Although the prairie has lower native species coverage, it is not unusual since the community is still developing. A native coverage of 75.63% is considered good after 3 years of establishment because of the typical influx of weed species that emerge from the seed bank in the earlier years. Since restoration efforts included only seeding within this community, the number of annual, non-native species was expected to be higher during the first few years of establishment. As time progresses, this community will continue to develop greater native species coverage through succession. Continued monitoring and maintenance activities will also help ensure further development.

Although control has been very successful and invasive species coverage is limited to 10.49% throughout the entire project area including the invasive species treatment area. Species of greatest concern including reed canary grass, *Phragmites*, purple loosestrife, spotted knapweed and hybrid cattail each have coverages less than 1.0%; however, continued aggressive treatment throughout the upcoming growing seasons will be required to maintain these levels. Herbicide treatments and mowing operations should be conducted at the appropriate time of year to achieve best results. In some cases, maintenance activities should be conducted 2 or 3 times throughout the growing season in order to more effectively reduce populations. Invasive species control efforts will be minimal but critical moving forward in order to keep the invasive species of concern at bay and prevent any significant development of those species.

The new timed meander sampling protocol (adapted in 2017) appears to have been efficient in capturing the total number of species recorded for the harbor site. During the 2018 surveys a total of 237 species were recorded across all communities which is 76 and 109 more species than were recorded during the 2017 and 2016 surveys, respectively. Of those 237 species 37 are non-native, and of those only 5 are of greater concern (reed canary grass, *Phragmites*, hybrid cattail, purple loosestrife & spotted knapweed). The greater concern non-natives are currently under good control but will continue to need aggressive monitoring and treatments in order to maintain their suppression and inhibit their ability to become re-established.

In an attempt to re-establish wild rice (*Zizania aquatica*) within the Harbor, the original delineated area was modified in 2017 due to an unforeseen increase in water levels which was no longer conducive to the development of a wild rice plant community. The new planting zone was seeded with wild rice at a rate of 100 pounds/acre in the fall of 2017 and again in 2018. The new wild rice zone took exceptionally well to the 2017 seeding but will require continued seeding to become a self-sustaining population. Because the harbor system is more dynamic and less pristine than the typical location where you would find wild rice, additional years of seeding are required to reach the goal of a self-sustaining population where as a more pristine system would require less seeding to reach that goal.

Unforeseen, significant rises in water levels resulted in the loss of many of the planted woody species throughout the shrub-carr and wet mesic forest planting zones; therefore, performance standards regarding their establishment were not met. The unfortunate outcome reiterates that weather and site conditions will dictate the outcome of a restoration project no matter how much planning, preparation and maintenance goes into a project. Although not as many woody species survived as originally intended, shrubs and trees persist throughout the two communities and the native, herbaceous vegetation is thriving. As water levels recede, woody species will have the opportunity to expand and occupy those areas currently under water within the original designated, planting zones. Although not necessary, additional species could be planted at that time to increase diversity.

The shift in plant community zones and lack of woody species coverage should not reflect negatively on the overall outcome of the restoration activities completed within Menekaunee Harbor. The project resulted in the establishment of a healthy and diverse native vegetation community which increased wildlife use within the area, thus meeting the objectives and goals of the restoration project.

APPENDIX B

Timed-Meander Sampling Protocol

Timed-Meander Sampling Protocol for Wetland Floristic Quality Assessment

Wisconsin Department of Natural Resources

INTRODUCTION

This standard operating procedure (SOP) describes the methods used by the Wisconsin Department of Natural Resources to conduct timed-meander surveys of wetland plant communities to determine wetland plant community condition. This SOP should be used in conjunction with the Floristic Quality Assessment Methodology for Wisconsin (Bernthal 2003). This SOP is based on and modified from procedures first developed and employed by the Lake Superior Research Institute (LSRI) (LSRI 2013). Possible uses for this protocol include Natural Heritage Inventory (NHI) surveys of State Natural Area wetland plant communities, FQA Benchmark Project surveys, water quality standards compliance surveys, wetland restoration site monitoring and wetland assessments for regulatory purposes.

DESCRIPTION

In this method, wetland types are first identified using aerial photographs and/or site investigations of the potential wetland(s) to be sampled. Assessment Areas (AAs) composed of relatively homogenous vegetation, are defined prior to sampling but can be modified after the survey based upon the conditions and features encountered during the survey. Natural communities, as defined by the NHI natural community classification, serve as the foundational unit of sampling (Table 1). When multiple types are present at a site, multiple Assessment Areas must be defined. Assign a wetland AA to the natural plant community type that it most closely resembles. If the AA's plant assemblage does not match any Natural Heritage Inventory community the dominant vegetation type (e.g., herbaceous, shrub, forested) may be noted. Table 1 contains a crosswalk to the Eggers and Reed classification system (2014).

Timed-meander start locations should begin far enough from the edge of a community type or from an anthropogenic disturbance (i.e., roadway, residential development, etc.) to avoid including transition zones from other plant communities in the survey. However, if the assessment area is surrounded by roadways, residential development, or other anthropogenic disturbance the timed-meander start location may be located at the edge of the disturbance. The survey consists of a search for all plant species present within a pre- or post- defined Assessment Area and an estimate of abundance and percent areal cover for each species at the end of the search period. The search takes place during timed intervals documented by the time keeper. The timer is paused when surveyors need to divert their attention from the search for any reason, such as conferring on an identification, documenting a rare species, or investigating an area with a plant composition different from the target community. The total time spent searching is an indication of search effort. All plant species are recorded when first observed and search intervals are documented on the Field Sheet. After all search intervals are complete, abundance and percent areal cover over the entire Assessment Area is estimated for each plant species, and notes on disturbance and other observations are documented.

The assessment areas must have homogeneous representation of wetland plants associated with each wetland community type. If a different wetland community type is encountered during a timed-meander survey of a given targeted community type, the timer is paused and the size of the new plant community is evaluated. If the new type is greater than 900 m² (30m x

Timed Meander Sampling Protocol for Wetland FQA

30m) (9688 ft², 98ft x 98ft or approximately 0.09 hectare (0.25 acre), then the area is excluded from the Assessment Area and the search remains paused until the surveyors return to the targeted plant community. If necessary, the new community would need to be evaluated by a separate survey. If the new type is less than 900 m² in size, the search is resumed and the small pocket can be treated as an inclusion within the primary wetland type.

Invasive plant species and anthropogenic disturbances should be observed during the walk to and from the Assessment Area, and noted in comments on the Timed-Meander Survey Field Sheet. Additional condition assessment tools may also be used to evaluate the wetland's health. For regulatory decisions, the Condition Assessment in Section 3 of the Wisconsin Rapid Wetland Assessment Methodology version 2 (Trochlell 2014) should be used. A Disturbance Factor Checklist is used for rating disturbance levels for the FQA Benchmark Project surveys. For future wetland condition surveys the Disturbance Factors Checklist or a modification of it will be used to assess stressors that may be causing an impairment to the wetland.

Table 1: Examples of Wetland NHI Natural Communities and Crosswalk to Eggers and Reed (2014).¹

NHI Natural community	Eggers and Reed (2014)	Dominant vegetation type
Submergent Marsh	Shallow Open Water Communities	Aquatic Herbaceous
Emergent Marsh	Shallow Water Marsh	Herbaceous
Northern Sedge Meadow	Sedge Meadow	Herbaceous
Southern Sedge Meadow	Sedge Meadow	Herbaceous
Wet-mesic Prairie	Wet/Wet-mesic Prairie	Herbaceous
Calcareous Fen	Calcareous Fen	Herbaceous
Boreal Rich Fen	N/A	Herbaceous
Central Poor Fen	N/A	Herbaceous
Ephemeral pond	Seasonally Flooded Basin	Herbaceous
Open Bog	Open Bog	Herbaceous/Low Shrub
Alder Thicket	Alder Thicket	Shrub
Shrub-carr	Shrub Carr	Shrub
Black Spruce Swamp	Coniferous Bog	Forested
Northern Wet-mesic Forest	Coniferous Swamp	Forested
Floodplain Forest	Floodplain Forest	Forested
Southern Hardwood Swamp	Hardwood Swamp	Forested

¹ Additional wetland community types, e.g., muskeg, interdunal, etc., may be surveyed. For a detailed description of each Natural Community, please refer to "Wisconsin's Natural Communities" on the WDNR [NHI website](#).

Timed Meander Sampling Protocol for Wetland FQA

DEFINITIONS

Assessment Area (AA): Discrete, homogenous area of a target plant community that is to be thoroughly sampled during the timed meander survey. Large wetlands/wetland complexes may contain multiple wetland assessment areas.

EO - Element Occurrence: In the Natural Heritage Inventory, a population of a species or an example of a natural community or natural feature naturally occurring at a specific, ecologically appropriate location.

Search: Locating, identifying and documenting plant species presence, while mentally noting percent cover. Previously un-documented plant species are continuously added until the search interval is paused or ends.

Search Interval: A pre-defined time interval, maintained by the time keeper. The search time may be paused whenever the active search for additional species stops for various reasons, including taking time to work out difficult identifications, documenting rare species, adjusting the Assessment Area or other reasons.

EQUIPMENT LIST

- ◆ Clipboard
- ◆ Compass
- ◆ Digital Camera
- ◆ Field Guides
- ◆ GPS Unit
- ◆ Digital watch with countdown timer
- ◆ Hand Lens (10X objective)
- ◆ Maps
- ◆ Markers
- ◆ Pencils (and sharpener/extr lead)
- ◆ Plant Collection Bags (i.e., Ziploc® Big Bags)
- ◆ Weather-Proof Datasheets

PROCEDURE

1. Upon arrival at the site, the survey team of two or more people must completely fill out the top portion of the WDNR Timed Meander Survey Sheet (Field Sheet) in Attachment 1 or other form for the Assessment Area (AA) to be surveyed. Use the Natural Heritage Inventory (NHI) Natural Community Descriptions to determine the appropriate plant community classification for the AA to be surveyed. If the survey involves an existing NHI Element Occurrence note the EO code. If the plant assemblage does not appear to match a natural community, note the dominant vegetation type from Table 1.
2. Start locations on the AA must begin at a point clearly within the target community type, away from transitional areas or anthropogenic disturbance (i.e., roadway, residential development, logging, ditching, etc.). The exception to this is that if an AA is immediately adjacent to an anthropogenic disturbance, then the start location may be located near the edge of this disturbance.
3. Travel to the AA start location and record any disturbance (e.g., invasive plants, logging, ditches) encountered while traveling to the survey start-up point on side 2 of the Field Sheet. This can also be completed at the end of the survey after the entire AA has been surveyed.
4. Take a waypoint at the survey start point using a handheld GPS unit. Record the starting point on the Field Sheet in decimal degrees. Indicate whether the GPS is set to a tracking function. This will create a record of survey locations over the course of the search.
5. Designate a lead observer and a data recorder for each survey; the observer will conduct the taxonomic identification and the recorder will complete the survey Field Sheet and operate the timer.
6. Set the countdown timer on the watch for 5 minutes. Start the stop watch and begin timing the first, 5-minute interval of the timed-meander survey. Standing at the start point, record all plants (ideally to species) that can be seen from the four cardinal directions before moving forward in search of new species. Upon reaching the end of a 5 minute interval, the timekeeper should instruct other observer(s) to stop searching until the next time interval begins.
7. Record plants using the full species name. Because there are numerous and often conflicting resources for accepted plant names (USDA Plants, Flora of North America, various state herbaria lists etc.), it is important to limit confusion caused by using multiple names for the same species. Therefore, this protocol follows the Wisconsin State Herbarium's list of vascular flora, which has recently been updated to reflect the most recent taxonomic information and is available online. The State Herbarium nomenclature should be used for conducting plant surveys in Wisconsin whenever possible.

Timed Meander Sampling Protocol for Wetland FQA

8. Record on the Field Sheet and collect all unknown, uncertain, and/or difficult-to-identify plant species, which will later be keyed or identified by experts (or eliminated from the analysis if identification is not possible).
9. Advance the search from the start point once the initial plants from the area surrounding the start point are recorded. Proceed walking through the site, taking care to identify all species encountered and making sure to investigate all vegetation layers. The search must always stay within the targeted plant community type for the duration of the survey, with one exception:
 - a. If a different plant community type is encountered during the search, stop the watch to pause the elapsed time and evaluate the size of the community. If the new community type is less than 900 m²(30m x 30m or 0.09 hectares, 9688 ft² (98 ft x 98 ft) or 0.25 acres) the timed meander survey can continue through that community type.
 - b. If the new community type is greater than 900 m², pause the survey until the surveyors have returned to the target plant community.
10. After each 5 minute time interval, the recorder should note on the Field Sheet the time interval in which those plant species were observed (i.e. 0-5 minutes, 5-10 minutes, 10-15 minutes, etc.). At the end of each time interval the observers may wish to briefly confer over any unknown species before resuming the next time interval. This reduces the number of unknown species for later office determination.
11. If an interruption of the process is necessary (e.g., intensive consulting with field guides and conferring with other surveyors over a difficult identification, bathroom breaks, difficult terrain, or vegetation encountered), stop the timer to pause the interval, eliminating these interruptions from the elapsed search time.
12. Pause the search if a rare, threatened, and/or endangered species is observed. Record the plant species on the Field Sheet, the location of the plant using the handheld GPS, take a digital photo of the species, and note associated species and other relevant information needed for the NHI Rare Plant Form. Collect a specimen if authorized and warranted. Resume the stop watch after all field recording is noted.
13. Typically a minimum of 30 minutes of total search time is needed to thoroughly search an AA. Stop the search when:
 - a. A pre-defined area has been completely searched. For some uses of this SOP a search of an entire pre-defined area may be required, regardless of the time it takes, even if no new species are observed in a search interval, OR
 - b. After 30 minutes of search time, one or no new species is found during the most recent 5 minute interval, OR
 - c. After 30 minutes of search time, the number of species observed in the most recent 5 minute interval is less than 5% of the running total of recorded species (including unknowns). For example, if, after the 10th five-minute interval (50 minutes of elapsed search time), 100 species have been observed, and 4 or fewer species were observed in the 10th 5-minute interval, the survey should be ended. The justification for ending is that the survey has reached the point of

Timed Meander Sampling Protocol for Wetland FQA

- diminishing returns and has likely captured 90-95% of the species richness, and has likely captured 100% of the dominant and common species.
- d. The search may end earlier than 30 minutes only if the entire AA has been thoroughly searched and no species were found in the final interval.
14. After the last search interval is completed take a waypoint at the survey end point using a handheld GPS unit. Record the waypoint on the Field Sheet in decimal degrees.
15. Once the species list is complete assign each species a percent cover based on an ocular estimate of the percent of the AA covered by the canopy of that species (see Figures 1 and 2). Estimate to the nearest whole number. For species that cover 1% or less, use 1.
16. For each species, assign an abundance code based upon the class categories listed in Table 2 below. Abundance estimates give a qualitative estimate of relative frequency and can be used to make comparisons with historically gathered site data. They also provide valuable data to compare species with small areal percent cover.
17. Record other data on the Field Sheet, including soil texture and pH on side 1, if taken. Animal species observed and other observations are recorded on side 2.

Table 2. Abundance Classification

Symbol	Abundance Code	Description
A	Abundant	The dominant plants throughout the site
C	Common	Locally abundant or frequently encountered
O	Occasional	Occasionally encountered, or locally common but absent or infrequent across much of site
U	Uncommon	Infrequently encountered
R	Rare	Very few plants seen
