MAKING THE LAKESHORE GROW

Harvey A. Bootsma

*Associate Professor
Great Lakes Water Institute*

Tired of closed beaches?

Wondering what that terrible stink is on Lake Michigan?

The Lakeshore Natural Resource Partnership (LNRP) and the Wisconsin Maritime Museum are hosting a series of free seminars on topics related to the health of the Manitowoc River and Lake Michigan. Our river and lakeshore provide for an unsurpassed quality of life here in Manitowoc—a quality of life worth protecting and enhancing.

The first in the series brings Harvey Bootsma to speak on the link between phosphorus and cladophora. Cladophora is the cause of many beach closings which impact tourism and economic development. Although human health concerns are still not a primary concern, there are significant aesthetic and ecological impacts both of which are causing considerable concerns for landowners, municipalities, land management agencies, and the business community. Harvey will be joined by a panel representing agriculture, municipal stormwater, and homebuilders.

These seminars are one more way we can all discuss our responsibility to serve as stewards of the planet's largest watershed and discover solutions to the challenges we face.

Attend this free seminar and learn how the algae problem can be solved. By working together we can make a difference!
